NARRATIVE OF A VOYAGE

TO THE

ETHIOPIC AND SOUTH ATLANTIC OCEAN,
INDIAN OCEAN, CHINESE SEA, NORTH
AND SOUTH PACIFIC OCEAN,

IN THE YEARS 1829, 1830, 1831.

BY ABBY JANE MORRELL,

WHO ACCOMPANIED HER HUSBAND, CAPT. BENJAMIN MORRELL, JR.,
OF THE SCHOONER ANTARCTIC.

“If all our care
Gives us a gentle husband, one that binds
No galling yoke, happy our life indeed.”

“I to Iolcos ploughed the watery way,
By fondness rather than by prudence led.”

NEW-YORK:

PUBLISHED BY J. & J. HARPER,
NO. 82 CLIFF-STREET,

AND SOLD BY THE BOOKSELLERS GENERALLY THROUGHOUT THE
UNITED STATES.

1833.

[Entered, according to Act of Congress, in the year 1833,
by J. & J. Harper, in the Office of the Clerk of the
Southern District of New-York.]

TO MY COUNTRYWOMEN,

THE HAPPIEST OF THEIR SEX,

BORN IN A LAND OF LIBERTY,

EDUCATED IN A KNOWLEDGE OF VIRTUE AND TRUE
INDEPENDENCE,

SINGLE BY CHOICE, OR WEDDED WITH THEIR OWN CONSENT,

FRIENDS TO THE BRAVE, AND PATRONS TO
THE ENTERPRISING,

THIS HUMBLE NARRATIVE OF A LONG VOYAGE,

WITH SOME INCIDENTAL REMARKS,

IS

RESPECTFULLY AND AFFECTIONATELY DEDICATED,

BY THEIR OBEDIENT SERVANT,

A. J. M.

P R E F A C E.

WHEN I took up my pen to prepare my journal for publication, I intended to make nothing more than a plain narrative of the events of my voyage, interspersed with such general remarks as might suggest themselves to my mind. But as I proceeded, I felt an irrepressible desire to make some observations on a subject which has become an object of no small interest to philanthropic sympathy—I mean the amelioration of the condition of American seamen. I believe that their habits can be reformed; and it requires no arguments to prove how much this reformation would subserve the best interests of commerce.

It may be thought strange that a woman should take up a subject so foreign to those which generally occupy the attention of her sex. It was, however, deeply impressed on my mind that, being a woman, I was in some measure better qualified to offer a few suggestions on this subject than any one engaged in the navy or the merchant service. A writer so situated might be suspected of wishing to effect promotion or of seeking employment; and knowing the dislike the public have to remarks coming from a quarter where interest or prejudice may be mingled with the information offered, I thought they might at least expect sincerity from me. With all my earnestness to make these remarks, I tremble when I think I am about to offer them for the consideration of the public. Perhaps they will listen to me kindly. It has been said, that when Napoleon was brooding over

his disasters no one dared approach him but a pet child, who played around him and induced him to take nourishment and repose. Let the public therefore consider me in the capacity of the child ; and if there be any force in my suggestions, they will go for what they are worth ; if there be none, why they will pass off with a smile.

It is seldom, indeed, that a female can know any thing upon this subject ; but as I have had some opportunity of becoming acquainted with it, I hope I may be excused for venturing to give my opinion. I should be proud to be one of the humble instruments in improving the condition and raising the moral and intellectual standard of that race of men which ever has and ever will share in the prosperity and glory of our country. In life I would ask no higher gratification than to learn that the work of reform was going on successfully ; and desire no other earthly honour after death than an inscription on my tombstone declaring that the ashes of the mariner's friend repose beneath.

A. J. M.

New-York, January, 1833.

CONTENTS.

PREFACE Page 9

CHAPTER I.

The Author's Birth—Education—Marriage—Voyage with her Husband—Death and Burial at Sea—Bonavista—St. Jago—Blue Beard's Castle—Crossing the Equator—Sickness on board the Antarctic—Tristan D'Acunha—Storm at Sea—Island of Desolation—Character of a good Ship-master 13

CHAPTER II.

Lord Auckland's Group—Birds—Flowers—Forests—Peculiar kind of Flax—New-Zealand—Visit from the Natives—Their Appearance—Visit to the Bay of Islands—Whale-ships—Courtesy of their Commanders—Visit to the Missionary Establishment—Character of the Missionaries—The Changes they had effected among the Natives—Visit to the King and Queen—Courteous Reception—King's Speech—Presents from the King and Queen—Departure—Strong's Island—Appearance of the Natives—Discovery of several Islands—Difficulty of Navigation in these Seas—Discovery of more Islands—Reach Manilla—Description of the City—The Suburbs—Description of the People—Grave-yards—Difficulties at Manilla—Preparations for a Voyage to Islands in the South Pacific—Return of the Antarctic—Misfortunes at Massacre Island 31

CHAPTER III.

Prepare for a second Voyage to Massacre Island—The Crew—Reach Massacre Island—Contest with the Natives—The Appearance of Shaw, who was supposed to be dead—Account of his Sufferings there—Further Hostilities with the Natives—Description of the Means of Defence—Attack upon the Castle—Discovery of the Remains of those murdered—Funeral Honours paid them—Leaving the Place—Bread-fruit Tree 59

CHAPTER IV.

St. George's Channel—Beauty of the Scenery—Birds of New-Britain—Natural Society—Warlike Instruments of the Natives—Island of Papua—Birds of Paradise—Volcanic Islands—New Discoveries—Hostilities of the Natives—Productions of these Islands—Ambergris—Return to Manilla 73

CHAPTER V.

Stay at Manilla—Visit to Convents and Churches—Spanish Ladies—Sketch of the History of the Philippine Islands—Earthquake—Appearance of the People after the Earthquake—Sketch of La Perouse's Voyages—Kotzebue—Captain Cook—Ledyard—American Whaling-ships—Their Voyages—Their Discoveries—Leaving Manilla—Arrival at Sincapore—Description of the Island—Tour to the Mountains—Ladies of Sincapore—Singing-birds—Farewell to Sincapore—Hospitality of the People—Horsburgh's Directory—Malays—Trade-winds—Isle of France and Madagasear—Mrs. Harriet Newell—Mrs. Judson—Missionaries—Luminous Appearance of the Sea—Sea and Land compared—Dr. Mitchell—Captain Gates 88

CHAPTER VI.

Saldanha Bay—Refitted—Visit to the Cape—Description of Saldanha Bay—Table Mountain—Comparison between the Animals found at the Cape and the Race of Men—Description of the Condor—His Habits and Character—The Albatross—His Habits and Character—Superstitions in Regard to the Condor—Hottentots and Lions—Character of the Lion—The Elephant—Ostriches; Description of, and their Character—Accuracy of the Scripture Account—Garrison at the Cape—Camoens and his Lusiad—The Character of this commercial Epic—Fate of the Author—Reflections upon the Restrictions upon Trade 127

CHAPTER VII.

Departure from the Cape—Sight of St. Helena—Its Appearance at Sea—Something of its History—Landing at St. Helena—Its natural and other Productions—Its Appearance on Land—Strength of the Place—Longwood—Tomb of Napoleon—Reflections at his Grave—Fernandez Lopez—Comparison between St. Helena and Napoleon—Soothing Effect of the Sublimity of the Scripture—Recrossing the Equator—Calm at Sea 145

CHAPTER VIII.

The Azores—Climate and Soil—Volcanic Origin—Liberia—Character of that Colony—Lot Cary—Effects of Exploring Expeditions—Missionary Societies—The bad Effects of Intoxicating Liquors—Indians unacquainted with Intemperance until taught by Europeans—Course that should be pursued by Missionaries—Intellectual Character of the Indians—Their Ferocity ascribed to Ignorance and Ill-treatment—Arrival at Cadiz—Disappointment in not being allowed to Land—Slight Sketch of its History—The Cholera—Notice of it in New-York 160

CHAPTER IX.

Arrival at Bordeaux—History and Description of the City—Delight at seeing the Flag of our Country—Literary and Scientific Institutions—Visit to the Tomb of Montesquieu—Comparison between Montesquieu and one buried in Trinity Churchyard—Sketch of the Archbishop of Bordeaux—His Residence in America—His Popularity there—His Charities—His Return to France—His Popularity in his Native Land—Reception of a File of American Newspapers—The Pleasure they gave—American Books—Their Authors—Farewell to Bordeaux 173

CHAPTER X.

Conchology—The Pearl-oyster—The Nautilus—The large Shell used for War Trumpets—The Eyestone—Character of Sailors—Causes of their Ignorance—Their Errors on the Side of Virtue—The Neglect of their Education—United States' Ship Vincennes—Manner in which Seamen should be treated—Character and Description of Sunday and Monday, two Natives brought Home in the Antarctic 187

CHAPTER XI.

Observations on the Progress of Discovery—Remarks on the Marine of various Nations—Aurora Borealis—Anecdote of its Appearance early in the last Century 208

CHAPTER XII.

Reflections on drawing near my Native Land—The Difficulties Women experience in gaining Information—The Value of Commerce—The Influence of Women—Love of the Ocean—Farewell to it—Sensations on arriving in the Harbour of New-York—Reaching Home—Public Attentions shown to my Husband and myself—Gratitude to Heaven for a safe Return 222

NARRATIVE.

CHAPTER I.

The Author's Birth—Education—Marriage—Voyage with her Husband—Death and Burial at Sea—Bonavista—St. Jago—Blue Beard's Castle—Crossing the Equator—Sickness on Board the Antarctic—Tristan D'Acunha—Storm at Sea—Island of Desolation—Character of a good Ship-master.

PERHAPS I owe the public an apology for appearing before them as an author. To become one was not my intention when, by the kindness of my husband, I was permitted to take a voyage with him into far distant seas; but as I have seen much and suffered much, I have been advised to give my narrative to my friends through the press, hoping it might afford some amusement to them as well as profit to myself. Another argument had much weight with me, which was, that I should thus be relieved of the necessity of answering questions frequently put to me by my friends and acquaintance when not in health, to run over all the adventures of my travels; and I thought, too, with the Moor of Venice, that if parts and parcels of my "hair-breadth 'scapes" would, at times, so much affect those I loved as I often found they did, the whole story told at once

would move them to some kind attention to, and affectionate remembrance of, myself.

It may be asked, who is the person that offers us her narrative? In this the reader shall be gratified, for short and simple are the domestic annals of one who has not reached her twenty-fourth year. My maiden name was Abby Jane Wood. I am the daughter of Capt. John Wood, of New-York, who died at New-Orleans on the 14th of November, 1811. He was at that period master of the ship Indian Hunter, of New-York. He died when I was so young, that if I please myself with thinking that I remember him, I could not have been a judge of his virtues; but it has been a source of happiness to me that he is spoken of by his contemporaries as a man of good sense and great integrity.

I was born on the 17th of February, 1809, in the city of New-York. My early education was plain and regular in those branches then taught in respectable schools in my native city. At my father's death, my mother placed the property which he left in the hands of a person who either by intention or mismanagement lost or retained the whole of it. This was a grievous affliction to my mother, as she was left with a family of helpless children to maintain. The belief that she was vilely robbed at first preyed upon her mind; but the consolations of religion lifted her above all her troubles, and she found the promises of the Gospel true, that, "I will be a husband to the widow and a father to the orphan." In 1814 my mother married Mr. Burrill Keeler, a gentleman of a kind and generous disposition, which has been manifested, not only to my mother, but to her children which she brought him at the time

of their union. I can say,—and I think it my duty not to pass over the fact in this narrative,—that I feel towards my step-father as we should to those to whom we owe our existence, and to whom we are indebted for that paternal care which springs from the laws of nature and the social relations of life.

The days of my childhood passed away as those of other children, and brought with them the pleasures and pains, common to that season of life: one of my greatest enjoyments, and one which has fastened most strongly on my mind, was derived from a constant attendance on Sundays at St. Paul's or Trinity Church. I often called to mind these images, while floating upon the vast ocean, and considered the value of early instruction in religion; the house of prayer and the heaven-breathing music, with the solemn voice of holy men, and the precepts that fell from their lips, seemed all to come up, as it were, before me, and extend the worship of God all around, while the mighty abyss of waters was beneath us. The impressions made in youth upon the eye or the ear, as well as those upon the heart, live long upon the mind; and there is nothing like distance from home, or solitude and danger, to brighten up these images. The mind seems to find new fountains of refreshing waters from these recollections, which, while they purify and elevate, strengthen the soul for the hour of trial.

Early in the year 1824 my cousin, Capt. Benjamin Morrell, returned from a long voyage to the Pacific Ocean. I had not seen him since I was five years of age, and had hardly the slightest recollection of him. At our first interview I felt a friendship for him that I had never felt for any

one before. His personal appearance, his gentlemanly manners, and humane disposition, which was seen in his benignant face, as well as his adventures, had an effect upon my mind that I did not think of lightly. His visits to our house were constant for several weeks, when he offered me his hand, and, the match being acceptable to my parents, we were married on the 29th of June. A short time after this event he informed me that he was soon to sail on a two years' voyage. I knew when I married him that I was to be the wife of a sea-faring man, but it was impossible for me to realize the distress of separation. Only a little month had passed away when my husband proposed to sail, and on the 18th of July this dreadful separation took place. I was calm, for it was a matter of duty and necessity; but no one who has not felt them can tell the pangs of such a separation. A bride of fifteen to see her husband depart for such a length of time requires more or less than the fortitude of woman.

He left me, and for many nights my dreams were of him, on a boundless ocean, tossed by storms or engulfed in the deep. To these gradually succeeded dreams of his being wrecked on desolate islands, and subject to all the violence of savage men. My feelings were probably the same as every good wife experiences when her spouse has left her for distant lands; but I was so young that I had never run over in my mind any thing of this kind before, and all was as new as distressing. At another time he would, in my imagination, be lying on a bed of sickness, with no one to give him a cup of cold water to cool his parched lips, or to render him a single act of kindness. "He has good sailors," said my friends. I was

silent, but thought to myself, "A sailor is not a wife." In this manner passed my nights and days, until my husband came home, which was on the 9th of May, two months short of the time fixed for his return.

I had heard that the vessel in which he sailed had arrived, and on going to a friend's with my sister to ascertain the fact, I met my husband in the street. Our meeting was such as might be imagined by one who has been separated from a beloved husband so long. All my anxieties were at an end—all my hopes were realized—my happiness was complete. There is a concentration of feeling, I may say of affection, after such an absence, that none but the wife of a mariner can know. I had dwelt upon the loves of those separated by the Crusades; but the longer they were gone, and the more perilous their adventures, so much the more delightful was the story. Yet it was not so to those mourning the long absence of him who roamed into far-distant lands, carrying with him plighted vows and everlasting affections. I have often thought that the ages of chivalry had not gone, as far as woman's love was a part of it. I believe human nature is the same in every age and nation, and all of good hearts feel alike, whether it is called romance or fact. I can say for myself, that I have felt more than I have ever known described.

After several European voyages,—during which we had a son, who, in his mother's eyes, bore a striking resemblance to his father,—in June, 1828, my husband sailed again for the South Seas. The separation seemed worse than before, and I then came to the determination that if he ever went to sea again I would accompany him. This voyage

was not so long as I thought it would have been ; he was gone but little more than a year, for he returned on the 14th of July, 1829. He had been but a short time on shore, however, when he planned another voyage to the Pacific. I had determined to go, and ventured to mention it to him. At first he would not hear a word of it, but when I insisted, as far as affectionate obedience could insist, he detailed to me all the evils of a sea-faring life. I remained fixed, and he at last reluctantly yielded ; and when he had agreed to it, he put the best side outwards. I was now engaged in making preparations for a two years' voyage, which was no small affair, for many things were to be thought of in such preparations.

All things being ready, on the 2d day of September, 1829, we embarked on board the schooner *Antaretic*, and set sail. The crew consisted of twenty-three good sailors. A fine breeze wafted us from the shores of my native country, and I soon began to feel the importance of my undertaking, as it regarded myself. I had left my boy behind me, and distance seemed to make me more anxious for his welfare. I knew he was in good hands, but he was not in my own ; I knew my dear mother would do every thing for him that I could, but nothing will satisfy a mother in regard to her offspring, but her own care. While I was thinking of these things I began to grow sea-sick. The sensation can never be described ; it prostrates sense, fortitude, feelings, and reduces the adult to the baby. On the morning of the second day I came on deck, and all was one boundless expanse of ocean ; the impression was one of magnificence, if my situation would not allow it to be one of pleasure. All was new to

me ; the management of the ship, the discipline of the sailors, &c. ; all were so respectful towards my husband and myself, and so gentle towards each other, that one would have thought them a band of brothers.

I often amused myself in gazing at the huge whales that tumbled about and sported in the deep around our vessel, seeming not to regard her any more than they would an egg-shell floating by them. The dolphins, too, so much admired by the ancients, as books tell us, were seen in great numbers. They were often noticed pursuing the flying-fish, who, to avoid their pursuers, arose from the water and kept in the air for the space of half a minute or more, and then fell into the water again ; sometimes they would fly on our deck, and we picked up some that would weigh nearly half a pound.

My sickness continued, and I was quite exhausted by it ; but I had embarked at my own solicitation, and I did not suffer myself for a moment to repent, nor complain. I considered that it was my duty to bear up as cheerfully as I could. My husband saw with pain how much I endured, and did every thing in his power to make me comfortable ; but after all his care, I suffered much more than I complained of. I walked until I felt faint, got a little better, and then took up a book ; but in a few moments the lines would swim before my eyes, and a tale of the deepest interest would affect me no more than the dullest story ever told by dozing senility. I have read of the stoics' bearing pain without any emotion, and wearing a smile on their countenances while their flesh was torn with pincers : it might have been so, but I think the most famed of that sect

would have looked a little pale in a fit of seasickness.

On the 29th of September, one of the crew, Francis Patterson, died, after a very severe illness, supposed to have been brought on by having drunk too freely of ardent spirits in the early part of his life, and now leaving off suddenly. My husband had shipped his crew upon condition that they should abstain from all ardent spirits, unless as medicine to the sick. He was the first captain, I believe, that ever shipped a crew for so long a voyage on such terms; and he found his account in it as a navigator, without saying any thing of the good done to the morals of these generally improvident men without such wholesome restraints. Patterson had reached the age of sixty-three, and had too long been in the use of ardent spirits to live many years, whether he abstained or not. He was a fine old sailor, and had only this single failing, which is indeed a great one, on the sea or on shore.

At four o'clock in the afternoon the funeral services of the deceased took place. I supposed that the body would be thrown overboard without much ceremony, but it was not so; the funeral was the most solemn I ever witnessed. The body was laid out with great decency, and then enveloped in a hammock and sewed up. About fifty pounds of stones were secured to the feet, concealed by the hammock in which it was wrapped, for the purpose, as I presumed, of sinking the body deep in the ocean. The corpse was extended upon a plank on the rail at the gangway, and all hands were called around, on the right side of the ship, to witness the solemn scene, and to join in the prayers to be offered up.

The colours were set half-mast, and the topsails and top-gallant-sails were settled down on the cap. Prayers were then read. The hardy crew were deeply affected at the scene. The furrows in their sunburnt faces were wet with tears. Never before had I beheld so solemn a group: I thought they had the kindest hearts of any set of men that ever lived. The prayers being over, a gun was fired from the bows of the schooner, and the body instantly launched into the bosom of the ocean. The plunge was a dreadful shock to my feelings! I had heard the first shovelful of earth thrown upon a coffin in a grave-yard, at home; that was heart-rending, but not so bad as this plunging into the deep. To the grave-yard a friend might repair, at some future day, and linger over the ashes of the dead; might erect a stone at his head, and compose the mind by writing his virtues on the marble; but here in this grave no mortal could tell where he was—the unconscious waters had closed over him for ever!

I was awakened from my reverie by the shrill pipe of the boatswain, calling all hands to duty. In an instant the sails were set, and we were gliding onward. There was no longer any melancholy in the countenances of the brave seamen; every one seemed to look as if he had done his duty, and had nothing to reproach himself with. The mate took his log-book, and wrote this sentimental epitaph: “Buried Francis Patterson this day, in latitude $16^{\circ} 35'$ north, and longitude $26^{\circ} 2'$ west from Greenwich. He died yesterday. The weather now fair, winds light.” “So sink the brave to rest,” was my reflection; and it is no matter where they rest, if they go down to the place thereof with the hopes of a resurrection and a life to come.

The winds were light and variable until the 4th of October, when land was discovered on our starboard bow (I had now learned most of the sea-phrases). After land was announced by the sailor at the mast-head, my husband went up, and I watched his ascension without emotion, for I had become familiar to the climbing of the sailors; a month before I should have gone into fits to have seen him in what I then considered so dangerous a situation. The land proved to be St. Nicholas. The next day we saw the island of Bonavista, and in the afternoon we came to anchor in the harbour, about two miles from the town. It was pleasant for me again to see land, men, shipping, churches, &c.; things I had been accustomed to all my life till the last thirty-three days. There was a breeze came from the shore that seemed to me to be refreshing. These men and women, though not wondrously well-looking, appeared to me to be beauties. I had seen nobody but our shipmates for so many days—many days for a female sailor. These few days, on retrospection, appeared to me nearly as long as my life had been.

Early in the morning we received a visit from the health-officer, and at ten o'clock my husband and myself went on shore. The officer took us up to the governor, who with his amiable family received us with great kindness, and made us acquainted with their friends. Kind attentions are at all times pleasant, but when one is away from home it is delightful indeed to meet with those who love to pay all the courtesies of life as if it was their pleasure and happiness to do so. My stay was short, but I shall long remember the politeness, yea, friendship of that accomplished

family. They attended me to the boat, their servants bearing presents of such things as would be wanted on our voyage. Our separation came: we ladies embraced, and left each other with tears. There is something in these transient attachments which shows us that we were born to do each other good, notwithstanding all the evil there is in the world. We were soon out of sight of these hospitable shores. I waved a last adieu to friends whose kindness had made me love them as sisters, and then I was long silent, while our bark was moving on at the rate of eight or nine miles an hour. There is something soothing in this rapidity of motion when our minds have been agitated by a variety of thoughts and feelings.

Early the next morning we made the islands St. Jago and Mayo. We came to anchor in the harbour of the former. The bottom, I noticed, was a beautiful white sand. The American consul's flag was flying about a mile and a half distant. We soon went on shore, and were kindly received by him. Mr. Merrill, the consul, took great pains to give me all the information he could about the place. My friends pointed out to me the ruins of a castle, which they said was the residence of the famous BLUE BEARD, in his time. This was no doubt true, as this island and those in the neighbourhood were the rendezvous of the Bucaniers of America, who, after having robbed the Spaniards and others, came to these places for security. The island abounds in vegetables common to tropical regions, of which we took in a good stock, and filled our casks with pure water.

We left these hospitable friends with regret, and with light winds made the best of our way

towards the equator. We had, from day to day, frequent falls of rain, with quick and heavy thunder. Sometimes flash would follow flash until the heavens seemed in one continuous blaze. On the 23d of October we crossed the line, in longitude $22^{\circ} 10'$ west. About 4 o'clock, P. M., I witnessed the amusing ceremony of a visit from Neptune. He came on board, not precisely with such a trident as he holds in classic paintings, nevertheless he did well enough for green hands, in which number I suppose he ranked me. With great good-nature he shaved a few of the crew who had never before crossed the equator; and the sailors thought for the first time in his life he made all merry without being treated with one drop of ardent spirits. Although he did not pretend to have any power over a female sailor who had never crossed the equator, I thought it best to propitiate him with a few small presents, which seemed to be acceptable to the great monarch of the ocean. He understood English very well, although the Portuguese say that theirs is his mother-tongue. The English language, from the use made of it by the seafaring-men of both the mother and the daughter, must have been far more familiar to him, for a century or two past, than any other tongue; and from all appearances, he is likely to adopt it as his court language. These things are pleasant enough to pass away an hour; and I have been at sea long enough to find that the art of managing sailors consists in keeping them temperate, industrious, cleanly, and cheerful. They are always obedient when healthy and comfortable.

We had now got into the south-east trade-winds, and the weather being pleasant, my husband

began to exercise the crew in the management of the big guns, and in the use of small arms. The old tune of "Yankee Doodle," which was played when the men had closed their exercises, sounded very pleasant in my ears.

The voyage, with all its vicissitudes, had been pleasant until October 26th, when I was taken sick with an intermittent fever, and at the same time eleven of the crew and the officers in the cabin. Among our complement of men was a brother of mine, a discreet lad, with acquirements far above his years. He was of great assistance to my husband, as well as a great comfort to me. The disease advanced so rapidly that in five or six days nearly one-half of our crew were prostrate with it. My husband, who still had sound health, was so constantly employed in attending to his vessel and to the sick, that I verily believe he did not sleep two hours out of twenty-four during the sickness. The second day of November was a bad one to us all. I was very weak, and my senses had at times been wandering, yet I could perceive that fresh calamities had overtaken us; but what they were was concealed from me. After my recovery, my husband told me that on that day he buried Samuel Gerry, and was fully impressed with the idea that his crew would nearly all of them die with the fever. The next day Daniel Spinney died; but all was concealed from me. One after another was carried out of the cabin, but I dared not inquire, and no one ventured to explain. I saw my husband's heart was full of sorrow, but I asked no explanations, knowing that I could do no good. My husband, still thinking it might injure me to know the worst, was silent; and I, believing that questioning would

add to his grief, adopted the same course. I learned from my brother, after a while, however, who dropped hints now and then, what was going on. I lost all hope, and began to think that it was my fate to be buried in the Indian Ocean. The feverish dreams that flitted across my imagination were those of being pendent in mid-ocean, of being devoured by sharks, or of wasting whole ages in rising and sinking in a world of waters. No hopes of a future life could rid me of these feelings—they belong to poor human nature. The fever now left us all, and we had to struggle alone with weakness. For myself, I was drawn all up like a cripple; but by the kind attention of my husband I began to recruit, although I had still much to suffer; and despite the application of linaments and frictions, I was a long time in getting into an erect position. In so short a time will sickness bring down the firmest constitution.

Weak as we were, my husband determined on touching at 'Tristan d'Acunha, for the purpose of getting poultry and other fresh provisions, to raise the sick by such refreshments as experience would dictate were good for them to receive. We now saw the island for so many days the object of our wishes, and on the 15th of November sent a boat ashore on the north side, the only part inhabited. There were about seven or eight men and as many women, with families amounting to about twenty children, on the island. I was carried on deck as often as my health would permit, to take a look at the land and to catch a mild breeze. On the land, which is elevated to a tremendous height above the sea, we saw goats and hogs, and a great variety of beautiful birds, both of land and sea kind. The land seemed to me much like

that of St. Helena,—which we afterward saw,—formed of high ridges and deep chasms, probably, as my husband thought, of volcanic origin. The whole shore seemed to be teeming with animated nature. Shellfish, seal, sea-elephants, and wild-fowl were found in great abundance. Excellent fish, particularly a large kind of perch, were furnished for our table. The right whale, particularly the female of that species, were playing around the shores. At certain seasons they come into as smooth waters as they can find, for they dare not trust their young ones to a wide and boisterous ocean until they have gained the strength of some months from their birth. Affection seems not confined to our breathing atmosphere, but lives in the deep ocean—on its surface—everywhere. God is love, and that love penetrates all his universe. That such a monster as a whale should have a heart, and feel for its progeny, seems strange, but would it not be stranger if such a body should be made without affections?

There is a bay on the N.N.W. side of this island, which is open to the north wind. The beach is of black sand, and extremely beautiful, upon which a boat may be hauled up at almost any season of the year. There are two or three sparkling cataracts upon the steeps, from which excellent water is taken without difficulty. Sometimes this is done by hose, without the necessity of landing the boat. The highlands are covered with forests, bearing the appearance of yew-trees. A great variety of plants grow on this island, proving that it has a soil fit for almost any kind of cultivation. It is free from reptiles and wild beasts, and seems to have come up from

the ocean for the benefit of man, as he wanders across the mighty deep. Tristan d'Acunha, from my husband's observations, lies in latitude $37^{\circ} 5' 40''$ S., and longitude $12^{\circ} 7' 15''$ W. This and the two neighbouring islands have long been discovered. The other two are called Inaccessible Island, and Nightingale Island.

After getting a good store of hogs, sheep, fowls, and various kinds of vegetables on board, we sailed on our voyage. For a few days we had pleasant weather, when a gale struck us, which was the first of any magnitude that we had experienced since we left New-York. This was tremendous. Every moment I expected to be engulfed in the ocean. Several times I was most violently thrown out of my berth by the surges of the sea. After blowing hard for two days, the gale abated on the 1st of December. We continued our course to the island of Desolation, with strong winds, and now and then a storm of hail and snow.

On the 5th of December, we were again cheered by the sound of "Land ahead!" and soon came into smooth water. We entered the harbour which was discovered by Capt. James Cook, the celebrated navigator, in 1776. No place in either hemisphere hitherto discovered, affords a better field for a naturalist than this. The sea-birds are numerous, including several kinds of albatrosses—a greater variety than I ever saw before: they were so thick around the vessel that they were in each other's way. Seals and sea-elephants were once numerous here also.

From this romantic place we sailed for Lord Auckland's group. I now began to feel some appetite, and relished the delicacies we had on

board; but the fever had left me in a sad state. I saw but little of my husband, as the weather was boisterous, and he was confined most of his time to the deck, as his officers were yet weak and unable to do their duty. I was in constant alarm for fear my husband would get sick, and it was a mercy that he held out so well. A kind Providence overrules our destinies; and I was penetrated with gratitude to Heaven that he was spared to be the protector of us all. If his gentleness and benevolence had won my heart, his fortitude and bravery in the most trying scenes excited my admiration; and, if I might be allowed to say it, my pride was raised that he was capable of taking care of others as well as myself; for I could see that the sailors were never discouraged; they had such confidence in their commander that they never thought of danger when with him. The more feeble we are, the more we confide in those who can protect us.

It is impossible for a woman to understand the true character of her husband by only seeing him in the domestic circle: she must watch him in trying circumstances, and where she cannot be called to counsel and advise, to form a just estimate of his qualifications for the discharge of his public duties. In these trying situations my husband was as calm as if only in the ordinary discharge of his duties. He was by the dying bed of the sick among the sailors, as well as by mine, and seemed all energy, resignation, hope, and decision. I could not but apply to him, however partial it may seem, the fine description of the sailors' poet, of the commander of a ship he sailed in to the Hellespont and Greece. 'The genius of Falconer, his sufferings, and his un-

timely fate, as well as the inspirations of his muse, endear him to every seaman's heart; his *Shipwreck* is truly a sailor's epic.

“The lovely ship, with all her daring band,
To skilful Albert owned their chief command :
Though trained in boisterous elements, his mind
Was yet by soft humanity refined ;
Each joy of wedded love at home he knew,
Abroad, confess'd the father of his crew !
Brave, liberal, just ! the calm domestic scene
Had o'er his temper breathed a gay serene :
Him science taught by mystic lore to trace
The planets wheeling in eternal race ;
To mark the ship in floating balance held,
By earth attracted, and by seas repelled ;
Or point her devious track through climes unknown,
That leads to every shore and every zone.
He saw the moon through heaven's blue concave glide,
And into motion charmed th' expanding tide,
While earth impetuous round her axle rolls,
Exalts the watery zone, and sinks the poles ;
Light and attraction, from their genial source,
He saw still wandering with diminished force ;
While on the margin of declining day
Night's shadowy cone reluctant melts away,
Inured to peril, with unconquered soul,
The chief beheld tempestuous oceans roll :
O'er the wild surge, when dismal shades preside,
His equal skill the lonely bark could guide ;
His genius, ever for th' event prepared,
Rose with the storm, and all its dangers shared.”

CHAPTER II.

Lord Auckland's Group—Birds—Flowers—Forests—Peculiar kind of Flax—New-Zealand—Visit from the Natives—Their Appearance—Visit to the Bay of Islands—Whale-ships—Courtesy of their Commanders—Visit to the Missionary Establishment—Character of the Missionaries—The Changes they had effected among the Natives—Visit to the King and Queen—Courteous Reception—King's Speech—Presents from the King and Queen—Departure—Strong's Island—Appearance of the Natives—Discovery of several Islands—Difficulty of Navigation in these Seas—Discovery of more Islands—Reach Manilla—Description of the City—The Suburbs—Description of the People—Grave-yards—Difficulties at Manilla—Preparations for a Voyage to Islands in the South Pacific—Return of the Antarctic—Misfortunes at Massacre Island.

FREQUENTLY on our passage from the island of Desolation to Lord Auckland's group, we could not keep a fire to cook any thing, for the waves often swept over us; and our sails were splitting and spars were falling around us every day. It was on the 29th of December that we reached this group, and at eleven in the morning the crew went on shore to get shellfish and other things that we wanted, while the vessel was riding safely at anchor in a fine harbour. I amused myself in listening to the sweet notes of the ten thousand beautiful birds warbling among the forest trees, within fifty yards from the stern of the Antarctic. I had been assisted to the deck by my husband and brother, and weak as I was, I felt new life at the scene. In the ecstasy of the

moment, I felt that all the flowers were opening to receive me—that the birds sang a joyous welcome for me—and the “incense-breathing morn” was charming to my senses. To one who has escaped the dangers of the sea—who has been long prostrate upon a sick-bed—a gleam of sunshine is reviving; but now all my senses were banqueting at once. If ever gratitude to my Maker penetrated my heart, it was at this moment; if ever I poured out that heart, it was at such enjoyments as I now felt. Such moments as these are an equivalent for long days and nights of pain. The sea around me was full of alabatrosses and aquatic birds of all sorts which are found in a temperate climate. The land was picturesque—the hills beginning to rise almost from the water’s edge, with deep valleys between them, each terminating at the shore in small caves. The forests were very luxuriant, and showed the strength and fertility of the soil, which was covered with numerous plants not common to my own country. I noticed several that I was acquainted with, and many that I did not know. One plant here deserves to be particularly mentioned: it is a species of flax that bears a yellow flower, and grows near the seashore, and sometimes far up the hills. The threads of the heart are silky; and, in the opinion of my husband, it might be raised in our southern states, and by its abundant growth and easy cultivation soon supersede hemp-fields, as well as those of flax. The season here at this time answers to our July; though not uncomfortably warm at any part of the day, the thermometer not rising above 65° at noon. The land-birds were large brown and green paroquets,

large wood-pigeons, and a great variety of small birds. Among the latter there is a green bird, about the size of a robin, whose melody is so fine, and his notes so varied, that one might imagine himself regaled by a hundred different sorts of songsters at once. The animals here are mostly strangers to man, and have but little fear of him. It is seldom that they hear the murderous gun of the sportsman; and the ornithologist in his rambles around the globe has, perhaps, never been here to write the biographies of these tenants of the forest. The fish here are good, and can be had at all times.

On the 4th of January we sailed from the Auckland group; our vessel was in fine order, and we seemed to set out as on a new voyage. The group at which we were so much refreshed lies in south latitude $50^{\circ} 40'$, and $166^{\circ} 4'$ east longitude.

On the 6th of this month we saw the south cape of New-Zealand. The boats were sent to examine the shore, but found no fur-seal upon them, the obtaining of which was one object of the voyage. The boats continued to examine the shores of the south-east and east sides of Night Island. The winds were light and the weather fair, and on the 12th of January, at noon, we had a visit from the natives, who came off to us in a war-canoe, which contained about fifty men, two of whom were principal chiefs, from Flat Point. These chiefs were whimsically tattooed; their ears marked, and their bodies stained with red or blue. From all that we could learn, their chief occupation is war. They carry about them a greater variety of offensive and defensive weapons than most other savages. Their looks are

bold and fierce, and they have no small share of martial dignity. Like other savages they delight in the war-song, and carry their phrensy and fury to the greatest excess. They have been, as near as I could learn, cannibals, and now, when prisoners are taken, they frequently cut from them while alive pieces of flesh and masticate it, to show their fury and fiendish joy at their success. Their dexterity in the use of their war-clubs, spears, &c., is said to be surprising. Their affections are strong; they mourn their dead with all those marks of phrensy so often described to us as belonging to savage life. They cut themselves—tear their flesh—and utter the most piercing cries. Polygamy is allowed among them; a chief having two or three wives, or perhaps as many as he wishes to maintain; or it may be, that the number marks the rank of the warrior or chief. The females are generally quite young, many of them mothers at the age of twelve or fourteen. Ignorance is the mother of superstition, and these savages have it to a great extent. Their priests are arbitrary, and keep them in fear, being under that bondage themselves. I have marked that they observe their fasts and their prayers from impressions of fear. The love of God is not known where ignorance abounds; it is that love, properly known, that casteth out all fear. Some of these superstitions make them vigilant and daring, as well as cautious; they believe that the spirit of him who was killed and devoured by his enemies suffers everlasting punishment in the world of spirits, but if rescued and buried his spirit ascends to the abode of their gods. This opinion generally prevails throughout all the southern hemi-

sphere among the savages. These savages have more curiosity than our North American Indian are said to have, for they examined the Antarctic with great scrutiny and apparent delight, and took their departure in the most peaceful manner. We continued the examination of the shores, holding frequent intercourse with the natives.

On the 19th of January we saw Cape Briton, and soon after came to anchor in the Bay of Islands, about five miles east of the missionary establishment, where we found several English whaling-ships, viz. the ship *George*, Captain Gray, from London; the *Royal Sovereign*, Captain King, and the *Thetis*, Captain Gray, from the same place. These were skilful, enterprising navigators, and very gentlemanly men. They all treated us with the greatest kindness, and I dined on board of each in turn, and received every attention that could be paid to a female in a distant country, whose very situation excites some sympathy and great courtesy. It is pleasant, if it is even at the farthest side of the globe, to be where national prejudices are forgotten, and all are of the same family. It is impossible for those who speak the same language not at times to love one another.

On the 20th of January, 1830, the English captains, my husband, and myself, went to pay our respects to the good people of the missionary establishment. My heart was overflowing at being once more in the embraces of Christian friends. Oh! there is religion in the world, said I, mentally, when I saw the accomplished females who had left all the comforts of society and the charms of friendship in England, to come to these shores of heathenish ignorance and ferocity,

for the sake of extending the Redeemer's kingdom, putting their trust in him, and overcoming the vanities of this world. Their labours were incessant; for they did not allow themselves more than eight hours out of the twenty-four for repose and meals. All the rest were devoted to civilizing and Christianizing the natives. The male missionaries work many hours in the field, clothed in duck frocks and trousers, with the natives, learning them to cultivate their lands. They then spend several hours in the day in teaching the natives to read and write, and to understand the precepts of our holy religion. The wives and daughters of these pious labourers are engaged in teaching the females to sew and to read. The natives are devout and tractable. These missionaries seemed to have as many under their care as they could readily teach, and their influence was spreading far and near, and is now extremely powerful. A few years ago not a ship's crew could land without arms and a guard, and perchance, some of them were massacred in attempting to get a little wood or water; but now they may travel anywhere to the extent of a hundred miles around the missionary dwellings, and eat and sleep in security, without guard or arms, or without fear. When a vessel arrives the natives are seen flocking to the shore, extending their arms to receive the white men from a distant country, bringing with them the fruits of their agriculture in great quantities, at the lowest prices. A quarter of a dollar here, I am positive, would purchase more than could be had in the New-York market for two dollars.

The common kitchen-garden vegetables are excellent, and in fine variety; some apples may

be had, and the small meats and poultry are supplied in abundance. Beef is not as yet much in use, but soon will be raised, as much as will be required. When I thought of these changes, produced by such feeble means, I wondered how any one could doubt the truth and efficacy of the Christian religion. Here, without the shedding of one drop of blood, Christianity had been planted; it had been as the tree of life in a forest of the upas, and the healing in its leaves had brought out and spread abroad light and salubrity where once darkness and pestilence reigned.

The whole party remained with these good people until about four o'clock in the afternoon, when we proposed leaving; but they were anxious to have us all stay with them while we were on the coast. The captains declined, as they did not think it proper to sleep away from their vessels, for the wind often blows hard here, and sudden squalls are common, but my husband consented that I might stop for one night. Often when joining with them in their devotions I asked myself, can there be any thing selfish in this? is it not pure and undefiled religion before God? it can hardly be called before man, for there were no civilized men to observe them. How happy they seemed! indeed, how happy they were, although so far removed from the dear country of their birth and the friends of their childhood. Even prayer itself is purified on such an occasion and in such a place; it was no great stretch of the imagination for me to think myself joining in the devotions of those who had lived in paradise in primitive innocence.

I now felt myself recruiting very fast, for I could walk a few rods without assistance, my limbs beginning to come to a natural state of

feeling ; but inflexible duty would not suffer my husband to linger here on any account. He came for me on the following day, and I was obliged to take a painful farewell of these holy people. Mr. Davis and his daughters, Mr. Williams and his wife and daughters, and some of the natives, came to take their leave of me. They prayed for my temporal and eternal happiness, and for my friends, and then sang a hymn that went to my soul, and waked up all its sympathies. They all accompanied me to the beach, and with tears, embraces, and kisses, I and my female friends parted,—they to attend to duties, and I to be tossed again by the winds and waves, to encounter new hardships, and to enjoy new adventures. On my reaching the deck of the Antarctic I was received by my brother and our brave tars with three hearty cheers, which were repeated by the crews of the English ships alongside of us, and to close the scene these cheers were echoed and re-echoed by a thousand native voices, in the canoes and on shore.

The next day we could not sail as we expected, the wind blowing too fresh from the north. The natives, seeing this, were desirous that we should again come on shore, and an invitation for us to visit them came from the king and queen, which was accepted. This was the 23d day of January, 1830. The boats of the Antarctic were prepared, and those of the ships joined, amounting in all to twelve whale-boats, handsomely manned. The natives had expected us, and came in myriads to see us. On touching the shore we were met by KIPPY-KIPPY, the king ; the queen then approached, and extended her hand most courteously to welcome an American woman to her territory.

Her appearance was affable and kind. After our greeting was passed, she waved a fan she held in her left hand, and at this signal more than seven thousand of her train, of both sexes, broke out into a song of joyous welcome; after which they gave three cheers that made the welkin ring. They then formed two double parallel lines, the females composing the inner, and the males the outer sections. As we advanced the females fell on their knees, and the males on one knee. I was carried on a sort of stage or chair, by six of their principal warriors, who proceeded with great state and solemnity, decorated with feathers of different kinds. Some of their ornaments were of surpassing beauty. The women all bore a green branch in their hands, and the heads of the men were ornamented with branches and feathers. When we came within fifty yards of the king's palace, the pathway was strewed with beautiful wild flowers, quite to the door, where we found elegant mats spread for at least ten yards square. The king now spread before us a superb banquet of the choicest fruits of his clime, and the young women entertained us with many songs, of no ordinary melody; after which the warriors gave us a war-dance for our amusement. There were at least two hundred of them. The king then came forward and made us a speech, and to my surprise, he spoke very good English. The substance of the oration was in praise of the missionaries. He said that before these good men came they knew nothing, but that now they were good men; that they could now lie down and sleep without fear of being killed by their enemies; that now they could sleep in peace; and that before these good men came, they had eaten human flesh, and

thought it acceptable to their gods. The night coming on, I could not obtain all the information I could wish. I acquainted the queen that I must now leave her and go on board; at which she clasped me in her arms, and kissed me several times. She made me many presents of elegant mats and delicate shells, when I took my departure, and was attended to the boats with great ceremony. The bows being directed to our vessels, the tars, both English and American, dropped their oars at a signal, and the boats were propelled like dolphins through the water.

As soon as we left the beach, the natives gave three cheers, which were answered by our men with great glee. In a few minutes we reached the Antarctic, where we found a great many canoes alongside, loaded with potatoes and hogs in abundance, presents from the king and queen. It would be difficult after this to make me believe that missionaries could do no good among savages; such as we saw would do good anywhere. In a few short years all within their influence had been softened, and every one was anxious to be more enlightened. Some had all the gentleness that attends the polite and good in any country. The terrific monarch of fierce warriors was now as courteous as a man could be, brought up in the bosom of polished society, and at the very first opportunity made an open acknowledgment of his obligations to religion and letters. I did not consider that these honours were paid to me as an individual, but to all females of my own country and to those of the English nation.

The next morning, January 24th, we took leave of all our English friends and the natives, got under way, and put to sea with a fresh

breeze and a light rain, bound to Manilla. We continued on our voyage with occasionally thick weather and brisk breezes, until we reached the latitude of $1^{\circ} 23'$ north, and longitude $170^{\circ} 2'$ east. We now, February 16th, found ourselves in the north-east trade-winds, with fair weather, and on the 19th, in the morning, we saw Strong's Island, which lies in latitude $5^{\circ} 58'$ north, and longitude $162^{\circ} 55'$ east.

This island is about ten leagues in circumference, and of moderate height, as it appeared to us from the sea. The uplands are all covered with thick forest trees, and the low grounds with fruit trees. The appearance of the natives is wild; they have long hair, and their complexion is of a light copper colour. Their canoes are light, and from ten to fifty feet in length. They paddle them through the water with great skill and dexterity. They have a great partiality for trinkets, red paint, and all sorts of cutlery. An old iron hoop will purchase a plentiful supply of fruit—a strong proof that they are not often visited by Europeans, as Indians soon grow sagacious in their traffic. It is thought by navigators that this island contains sandal-wood and other valuables.

We continued our voyage with a fine wind and pleasant weather, occasionally seeing indications of land, such as grass, trees, sperm-whales, and many kinds of sea-birds.

On the 23d land was again seen from the mast-head, which proved to be seven small islands surrounded by a coral reef. These islands my husband said he believed had never been seen before; they certainly were not on any chart we had on board, and we were well provided with

maps and charts. They are thickly inhabited, and are rich and fertile. We were in an unfrequented track, expecting to meet with shoals and new islands, and he therefore took the utmost precaution in keeping a look-out. Men were stationed at mast-head and other places, to mark the slightest appearance of danger. On the night of the 23d, breakers were discovered ahead, but by the timely precautions of my husband all difficulties were avoided, although we were in imminent danger, as I afterward understood from all the officers on board. I saw that the men had been much frightened, but my husband never talked of danger, nor did he ever permit me to think of it. I was, however, sadly alarmed at the time from his manner of command, and the thoughts of my child, my mother, and all my friends, rushed to my mind at once, and I felt that I was to be called to leave them; but Heaven ordered it otherwise—we were all saved. These hair-breadth escapes are better felt than described.

In the morning we took a view of the coral reef on which we had nigh been stranded. Within its circle were a large number of small islands, and within these we could easily distinguish four large high islands, which appeared to be very fertile, and covered with timber and fruit-trees. Several canoes were seen within the reef, filled with men, who seemed to wish us to anchor; but the number we saw made my husband think it might be hazardous to do so. One of the canoes ventured near us; the men were large, long-haired, and of a light mulatto colour. They were warlike in their appearance, but showed no signs of hostility. To these islands my husband gave the name of *Bergh's Group*, in honour of Edwin

Bergh, Esq., of New-York. These islands, also, were not found upon any chart I have ever seen.

We kept on our course towards Manilla, and on the morning of the 25th of February discovered another unknown island, surrounded by a coral reef, which was but thinly inhabited; and as we were not prepared to trade with the Indians, we passed on without further notice at this time.

We continued on our course with fine north-east trade-winds and delightful weather, until the 5th of March, when we arrived at the Straits of St. Barnardino, and in the evening we came to anchor in the entrance of the straits. In the morning we passed through the straits, and were gratified by seeing a fine country. Boats were numerous, but we did not wish to be delayed by any intercourse with the natives. The weather continued fine, and on the 10th of March, we arrived at the port of Manilla, lying in longitude $121^{\circ} 0' 9''$ east, latitude north $14^{\circ} 35'$. The next morning we were visited by the health officer, and in the afternoon landed. This island is of great interest to the commercial world. It was early settled by the Spaniards, who built a walled city for security. The city within the walls is of an irregular form, narrow at each end and wide in the middle. A fine river runs through it, and makes it susceptible of being kept clean; but cleanliness is a rare virtue anywhere. The city is tastefully built, many of the houses being wholly of stone, and all of them have the first story of this material. The roofs are flat, according to the Spanish fashion, and most of the houses have a piazza, for the convenience of air and exercise. The streets are broad and airy, and the promenades, the most fashionable part of the city, are

elegant. The inhabitants are from twelve to sixteen thousand in number ; probably the latter is nearest to the truth. There is but little appearance of business in the city, as most of the merchants, and all the mechanics, live without the walls. The men and women within seem to have no special employment ; their whole business is to live and to enjoy themselves. There is an air of grace in the movements of Spanish females that marks them from most others. Devotion and amusement in such a place are the duties of the day. The churches are numerous, and make an imposing appearance. It is said that in this city there are more convents than in any other in the world of its size. There is one to almost every church, and the general voice of natives and foreigners declares that they are under excellent regulations. Looking at the convents as you pass along, you would imagine that one-third of the city was made up of these religious houses. The Catholic religion has one singular property, with all its parade and ceremony, in it ; and that is, of making those who profess it quite content with it. They seldom disturb themselves with any abstruse speculations. There is something quite imposing in their forms, and the enlightened seem as much attached to them as the ignorant. I was born a Protestant, and I trust in heaven that I shall die a Protestant ; but hereafter I shall have more charity for all who profess to love religion, whatever may be their creeds. The inmates of these nunneries live quite a different life from those without the walls of the edifice. They may be as busy at their devotions as those of the world at their pleasures, but not more so. This is an old coun-

try—older than my own; and all the habits and manners of the people are as fixed as those from whence they sprung. They have now no particular longings for Spain, but speak of that country as we do of England, although their governors are appointed by the king; but he has no politics in such a distant land, and they all enjoy a freedom, perhaps, not known in the mother country. The island has had its vicissitudes, but its course has been quiet and colonial, and the Spanish sway has never been interrupted except when it was taken by the British in 1762. It was ransomed at a million sterling, which has never been paid.

The suburbs of Manilla are crowded with inhabitants, principally Chinese. These people are skilful, and more industrious than the Spaniards or the mixed breeds; and it is said that they are honest,—comparatively speaking, I suppose. The soil of this island is fertile and pretty well cultivated; the sugar-cane grows abundantly, and from it is drawn a great staple in their commerce. All the usual vegetables are plentiful; but a principal part of the food of the poorer classes consists of fish, of which the waters are full of various wholesome kinds. The canoes, at all times of the day and night, are seen on the water with several fishermen in them, each carrying a light in the stern, which makes a most picturesque appearance. I could fancy myself looking upon one of our extensive meadows when the glow-worm was showing her beautiful light, and myriads of fireflies were on the wing. Physicians say, that when the firefly and the glow-worm are seen, the evening air has no noxious vapour in it. These people on the water never think whether the air is wholesome or not;

they were born to this task—it is their support—and they must meet it. The fish are so abundant that they are used for manure at certain seasons of the year, and are said to make the ground very fertile. To me, who was born and had lived till this time in a country of frost and snow for nearly half the year, it was delightful to be where perpetual verdure smiled—where fruits and flowers hung together by a law of nature, and seemed to shadow forth the destiny of man—when the old depart, and the young rush forward.

The palace at Manilla is a noble building, and was once the residence of a viceroy; but the hope of the Spanish nation in founding a great eastern empire was never realized, and never can be. It would not be difficult for a spirited people to conquer the Philippine Islands, so far as European power is concerned; but unborn ages will probably pass away before these possessions will become an object to any great maritime power; yet so jealous is Spain of her Eastern possessions, that a large body of troops is kept in pay here as a standing army to repel any attempt to take these territories from her. The government here, although arbitrary, is seldom oppressive to its own members; but there have been times in the history of Laconia in which the Europeans, from some assumed apprehension, have made general massacres among the Chinese on the island: one in the early history of the colony, and the other about the middle of the last century.

The Indian women here have, of course, some share of civilization among them, and are superior to the men. If I have read aright, females are always the leaders in civilization and Chris-

tianity; in this region they certainly have more of an air of civilization than the men, and are quite as industrious: however poor they may be, there is no appearance of slatternliness about them—every thing in their dress is neat, if not worth ten cents. The Spanish lady is always a high-bred woman, with no little of the spirit of chivalry about her. Some of them have splendid complexions of a bright orange tinge, with fine eyes, and beautiful hair, well turned limbs, and a graceful walk. If they had as much application as genius, they would have no superiors in the world. I have noticed their walk with admiration; it has a little of the martial staidness, with the elastic tread of the Lady of the Lake. If you could not say, as the immortal novelist and poet has said of his heroine, that

“A foot more light, a step more true,
Ne'er from the heath-flower dash'd the dew;
E'en the slight hair-bell reared its head
Elastic from her airy tread:”

you could say firmness and lightness were never more happily blended than in those females of genteel society who walk the fine promenades of this city. With them walking is as much of a science and an art as playing upon the Spanish guitar. I wish it was more attended to in my own country. I have heard an anecdote from good authority, which has always struck me as containing a good and wholesome piece of satire. An American female, some years ago, attended by her husband—a naval hero,—took a voyage to South America. Being of an adventurous spirit, she travelled into the interior of the country, mounted on a milk-white horse, of the beau-

tiful South American breed ; and being dressed in pure and elegant simplicity, and possessing a splendid form and face that would have been attractive anywhere, the inhabitants took her for the Madonna, and bowed the knee and fell upon the ground as she journeyed along. They followed her until she alighted from her horse, when they immediately questioned her divinity—there was nothing of the goddess in her movements—she had an awkward walk. It is not those who walk the most that walk the best : the spinner of street-yarn has seldom a majestic or a beautiful gait.

The ladies of Manilla have generally each a cabinet of beautiful shells, and a large collection of birds, of splendid plumage. In both of these curiosities the country is more rich than most others. These shells are often tastefully arranged by the ladies in their leisure hours ; and they have a method of keeping the plumage of their birds as beautiful as it was in the groves and in the rays of the sun. Great care is taken to preserve them with such spices as will prevent insects from injuring them.

During a great portion of the year Manilla is healthy, but there are seasons when it is visited by severe sicknesses. The cholera, now so dreadful a plague, and which is travelling all over the world, has been among this people and carried off thousands of them. It is rapid in its course, and comes to a sudden crisis ; but when I was there, it was more mortal in the country than in the city. They think they have in some measure got the control of the disease ; but of this I will not attempt to say much, as it has baffled the wisest of the healing art in every country

through which it has marched. This people think not much of death, for there is a sort of Asiatic notion of predestination with them which makes them less attentive to the means of curing or warding off disease than with my own countrymen. If they are not so anxious to prevent death as we are, they are more attentive to the remains of the dead. The Catholics observe all the rites of the church in the article of death, and all the rites of sepulture. The bodies of the Spaniards are buried in the church or convent-yards, or under the churches, with every due and solemn form. Sometimes in the country, and not unfrequently in the churchyards of the city, you will see a tombstone, and by its side or head a large tamarind-tree, as a holy shade. It supplies the place of a weeping-willow in the United States, or of a yew-tree in England. The Indians are, if possible, more attentive to sepulchral rites than the Spaniards; for they hold with ancient superstitions that the ghost is restless until the due burial rites are performed.

There are always some drawbacks in every country; even here, where you are regaled by the flowers of the orange and the fruit in the same breath, at times you are dreadfully annoyed by little red ants, that, like the frogs of Egypt, come up to the kneading-troughs, and to the very beds of the sensitive dons. It requires Yankee ingenuity to keep them from devouring you. The mosquitoes, at certain seasons, are very troublesome; they are large, sharp-set, and poisonous. This insect, I believe, is bred everywhere; or, at least, where nature is bountiful, and the soil luxuriant. They are an enemy, I am sure, that it is impossible to fight or avoid,

and those among whom they appear must contrive to act on the defensive only; by smoke and nettings one may contrive to be made tolerably comfortable.

I dwell, perhaps, too long in this city, but I must be excused; for it was here that I suffered much in my mind, although I found good friends among strangers. I have a painful tale to relate, but one of which it is impossible for me to give more than a faint outline. The cause of our troubles and mortification has, sometime since, gone to account for his acts and intentions to another than an earthly tribunal; but I know no reason why the truth, as regards the dead, should not be told, if done without bitterness or a spirit of revenge. As I hope for happiness, I will not set down any thing in malice.

Soon after our arrival in this island, my husband became acquainted with the American consul at Manilla. He was a man of respectable acquirements, and of courteous manners. In a few days, Mr. Morrell determined to fit out the Antarctic on a voyage to the Feejee Islands, for the purpose of getting a cargo of tortoise-shell, biche-de-mar, and other articles which are commonly found there. We were all busy and happy in getting ready for the voyage; and in the mean time the consul's attentions to me were courteous and friendly, but as yet respectful. At this time, as I discovered afterward, my husband began to suspect his intentions, and formed a new estimate of his character; but I could not fairly understand this, as he was silent on most subjects of his voyage. I conjectured, however, that all was not right from his manner. A few days before we were to sail, my husband intimated to me that

the Spanish government were opposed to *my* going with him on his voyage to the Feejees, but he could give no reason for it; nor could I conjecture why a harmless female could do any injury among the savages of distant islands. There was something extremely suspicious in it; but the truth did not, at the first moment, flash upon my mind, as it did afterward. I could not suspect my husband of deceiving me, because the voyage was not more dangerous in his and my view than what we had already gone through with. The next time I saw the consul all was as plain as day to me, though I dared not express myself freely to my husband, for fear of the consequences from his quick sense of injury, and his high spirit as a brave man. And then, again, my youth and ignorance of the world made me fear that I had put a wrong construction upon the consul's demeanour. I told my husband, that, painful as our separation might be, if his interest and that of his owners required it, I could and would make the sacrifice, and remain at Manilla, if he would provide me a place of respectability to reside at while he was absent, so that I should not be under the necessity of seeing the consul. At length a residence was procured, quite to my mind, with an English family, by the name of Cannell. The firm under which Mr. Cannell transacted business was Cannell and Gellis. I had formed some acquaintance with a niece of the first-named gentleman; she was a well-informed young lady, of about twenty years of age, and I had frequently seen the family of Mr. Cannell. I had made up my mind to stay with this worthy family, which I understood from my husband had been vilely aspersed by the consul,

and represented as people wanting in character and integrity, within and without doors. I was nearly distracted, for I saw every day that my detention was, as I thought, a mere trick of the consul's; and, as he became more hateful in my eyes, I determined to steal a march on him, and go on the voyage to the Feejees, at all hazards. On the day the Antarctic was ready for sea, my husband had so arranged the matter that my brother was to take me on board; this was so privately done, that I did not think my persecutor would have found it out; but in this I was deceived. When my husband came on board, he brought with him two American captains and an English captain; Capt. Daggett, of Boston, Capt. Snow, from the same place, and Capt. Harris, from London; and also, the second captain of the port, an officer of the customs. I now thought all was safe: and, while congratulating myself that in a few minutes I should be beyond the pursuer's power, I found, to my great distress, that the consul was on board. An altercation took place between him and my husband, in which he used every threat he could think of: and appealed to my husband as a man of honour, hypocritically assumed the tone of an injured man, and represented that he had pledged himself to the Spanish government that I should not go in the vessel, and that it would be ruin to him if he did not redeem his pledge; and added, that if this was not complied with, he must take the register of the Antarctic by force. This was, indeed, an idle threat; for we were out of the reach of the fort and gun-boats, and had a crew on board that would have destroyed the consul and his force in an instant on the slightest command from their

captain. The reasons the consul urged might, in my husband's mind, have had some truth in them, as he represented the government of Manila as being more jealous than even the Spanish government itself, and at last he consented that I should go on shore. This was a death-blow to me, and for an hour after hearing of the decision I was bereft of my senses; but when they came to me again, I found the three captains I have mentioned, with my husband, subdued like children. These almost strangers to me took so deep an interest in my fate, that I shall remember them with gratitude as long as my heart has a pulse to beat. They told my husband that they would protect me at all events. I was put on board the boat and carried ashore; and there being no conveyance ready to take me to Mr. Cannell's, the place which had been provided for me when I consented to stay, I was obliged to stand on the landing-place until my friends could procure one for me, subject to the gaze of every rude wretch who came there; and curiosity had collected many. From every appearance, I was fully satisfied that the consul had scattered slanders about me and my husband, in order that I might feel myself so shunned and ruined as to fly to him for protection; but I had made up my mind to die there before I would even speak to him. I was at length conveyed to Mr. Cannell's hospitable mansion, and treated with every possible kindness.

I afterward learned that Mr. Morrell came on shore that night, and not finding the head of the revenue in the city, could not get the protection and information he sought; and our friends Snow, Daggett, and Harris, fearing that blood might be spilled in the affray,—for the consul

had watched his movements, and was at the hotel almost as soon as my husband reached there,—interfered. The consul now assumed another ground, which was, that the Antarctic was showing false lights, and that her crew probably intended some mischief to the city. This was repelled as a base and false insinuation by all the gentlemen present. My husband's friends thinking it better for me to remain on shore a short time than for him to proceed to desperate lengths, took him by main force and put him on board his boat, taking his pledge to proceed to sea, and giving him theirs that I should be shielded from persecution and insult.

I was with these kind people from the 12th of April, 1830, until the return of the Antarctic on the 26th of June following. After my husband's departure my story was soon known to all the people of Manilla, and I was treated by them with great attention; amid all their kindness, however, I felt like one who was fifteen thousand miles from home, lonely and distressed. My mind was constantly agitated for my husband's safety more than for my own. During his absence I was frequently annoyed by notes from the consul, which I never deigned to answer. The government became acquainted with the whole story, and distinctly disavowed every connexion with the transaction, or even any the slightest knowledge of it. This gave me great satisfaction, as I then knew the extent of the consul's villany and gross falsehood.

On the seventy-fifth day after the sailing of the Antarctic, as I was looking with a glass from my window, as I had done for many days previously, I saw my husband's well-known signal at

the mast-head of an approaching vessel. I communicated this intelligence to my friends, who hastened to carry me on board. We reached the vessel, and I was no sooner on board than I found myself in my husband's arms; but the scene was too much for my enfeebled frame, and I was for some time insensible. On coming to myself, I looked around and saw my brother, pale and emaciated. My forebodings were dreadful when I perceived that the number of the crew was sadly reduced from what it was when I was last on board. I dared not trust myself to make any inquiries, and all seemed desirous to avoid explanations. I could not rest in this state of mind, and ventured to ask what had become of the men? My husband, with his usual frankness, sat down and detailed to me the whole affair, the substance of which was as follows. I shall only state the outlines; his Journal will give the particulars of the dreadful tragedy. I was in a manner prepared for the story by observing the sad looks of the survivors, who all seemed anxious to tell the tale, but waited for my husband to do it. At length he mustered courage to inform me of his melancholy disaster, in a brief and general manner, and I have not had courage at any one time since to go over the whole of it.

It seems, that after leaving Manilla, to me the memorable 12th of April, he discovered several islands, the particulars of which will be found in his Journal; but they not affording the articles he was in search of, he continued his voyage until the 23d of May, when he came to six islands that were surrounded by a coral reef. Here was a plenty of biche-de-mer, and he made up his mind to get a cargo of this and what shell he could procure. On the 21st, he sent a boat's crew on shore,

to clear away the brush and prepare a place to cure the biche-de-mer. The natives now came off to the vessel, and seemed quiet, although it was evident that they had never seen a white man before, and the islands bore no traces of ever having been visited by civilized men. The people were a large, savage-looking race, but Mr. Morrell was lulled to security by their civil and harmless appearance, and their fondness of visiting the vessel to exchange their fruits for trinkets and other commodities attractive to the savages in these climes. They were shown in perfect friendship all parts of the vessel, and appeared pleased with the attentions paid them. The crew were employed for several days in planting seeds in different parts of the island, where the best soil was found—seeds of such things as it was thought would be useful to them. The forge and all the blacksmith's tools were got on shore, but the savages soon stole the greater part of them. This was an unpropitious circumstance, but Mr. Morrell thought that he could easily recover them; and to accomplish this, he took six of his men, well armed, and marched directly to the village where the king lived. This was a lovely place, formed in a grove of trees. Here he met two hundred warriors, all painted for battle, armed with bows and arrows ready for an onset, waving their war-plumes, and eager to engage. On turning round he saw nearly as many more in his rear—it was a critical moment—the slightest fear was sure death. Mr. Morrell addressed his comrades, and in a word told them that if they did not act in concert, and in the most dauntless manner, instant death would be inevitable. He then threw down his musket, drew his cutlass, and holding a pistol in his right hand, he pushed for

the king, knowing in what reverence savages in general hold the person of their monarch. In an instant the pistol was at the king's breast, and the cutlass waved over his head. The savages had arrowed their bows, and were ready, at the slightest signal, to have shot a cloud of missiles at the handful of white men; but in an instant, when they saw the danger of their king, they dropped their bows to the ground. At this fortunate moment, the captain marched around the circle, and compelled those who had come with war-clubs to throw those down also; all which he ordered his men to secure and collect into a heap. The king was then conducted with several of his chiefs on board the *Antarctic*, and kept until next day. They were treated with every attention, but strictly guarded all night. On the following morning he gave them a good breakfast, loaded them with presents,—for which they seemed grateful, and laboured hard to convince their conqueror that they were friendly to him and his crew,—sent them ashore, together with some of his men to go on with the works which had been commenced; but feeling that a double caution was necessary, he sent a reinforcement to his men on shore, well armed. With these he sent more presents for those chiefs who had not been on board.

All were cautioned to be on their guard; but every thing was unavailing, for not long after this, a general attack was made on the men from the woods, in so sudden a manner that they were overthrown at once. Two of the crew, who were in the small boat, made their escape out of the reach of the arrows, and had the good fortune to pick up three others who had thrown themselves

into the water for safety. On hearing the horrid yells of the savages the whale-boat was sent with ten men, who, with great exertions, saved two more of the crew. The rest all fell, at one untimely moment, victims to savage barbarity! It was an awful and a heart-sickening moment; fourteen of the crew had perished—they were murdered, mangled, and their corpses thrown upon the strand without the possibility of receiving the rites of Christian burial, rites so desirable among all civilized nations. Four of the survivors were wounded—the heat was intolerable—the spirits of the crew were broken down, and a sickness came over their hearts that would not be controlled by the power of medicine—a sickness arising from moral causes, that would not yield to science nor art.

In this situation, Capt. Morrell made the best of his way for Manilla, at which port he arrived as I have before stated. I grew pale over the narrative; it filled my dreams for many nights, and occupied my thoughts for many days. I may say, almost exclusively. I dreaded the thought or the mention of the deed, and yet I wished I had been there; I might have done some good, or if not, I might have assisted to dress the wounded, among whom was my own dear, heroic brother. He received an arrow in the breast, but his good constitution soon got over the shock, though he was pale even when I saw him, so many days after the event. My husband had now lost every thing but his courage, his honour, and his perseverance; but the better part of the community of Manilla had become his friends, while the American consul was delighted, as we heard from unquestionable authority, with our misfortunes. He was alone!

CHAPTER III.

Prepare for a second Voyage to Massacre Island—The Crew—Reach Massacre Island—Contest with the Natives—The Appearance of Shaw, who was supposed to be dead—Account of his Sufferings there—Further Hostilities with the Natives—Description of the Means of Defence—Attack upon the Castle—Discovery of the Remains of those murdered—Funeral Honours paid them—Leaving the Place—Bread-fruit Tree.

CAPTAIN MORRELL now petitioned the governor of Manilla for leave to take out a new crew of seventy additional men, sixty-six of whom were to be Manilla men, as they are commonly called, meaning half-blood Indians, who have all the jealousy of the Spaniard and the cunning and ferocity of the savage. It was said that no ship had for years dared to take more than five or six of them on a voyage, and every one remonstrated against taking so many; but my husband contended that their resentments in former cases had been aroused by improper treatment, and he would try the experiment. The men were shipped, and the schooner ready for sea in a short time, notwithstanding the consul made every effort to prevent our obtaining any assistance in Manilla. But the tooth of the serpent was broken, for he could do nothing to prevent Messrs. Cannell and Gellis from coming forward and advancing my husband such means as were required to fit him out to retrace his course over the same pathless seas, and to the same savage lands.

On the 18th of July, 1830, the Antarctic was ready to sail again for the Massacre Islands, as my husband had named the group where he lost his men. When I went on board, I found a crew of eighty-five men, fifty-five of them savages as fierce as those we were about to encounter, and as dangerous if not properly managed. One would have thought that I should have shrunk from this assemblage as from those of Massacre Island, but I entered my cabin with a light step; I did not fear savage men half so much as I did a civilized brute. I was with my husband; he was not afraid, why should I be? This was my reasoning, and I found it safe. The schooner appeared as formidable as any thing possibly could of her size; she had great guns, ten in number, I believe, small arms, boarding pikes, cutlasses, pistols, and a great quantity of ammunition. She was a war-horse in every sense of the word but that of animal life, and that she seemed partially to have, or one would have thought so to hear the sailors talk of her. She coursed over the waters with every preparation for fight; and from experience I can say, that the more helpless we are, the more we delight in viewing all the preparations for defence.

On the 13th of September, the Antarctic again reached Massacre Island. I could only view the place as a Golgotha, and shuddered as we neared it; but I could see that most of the old crew, who came hither at the time of the massacre, were panting for revenge, although their captain had endeavoured to impress upon them the folly of gratifying such a passion, if we could gain our purpose by mildness mixed with firmness. We had no sooner made our appearance in the

harbour at Massacre Island, on the 14th, than we were attacked by about three hundred warriors. We opened a brisk fire upon them, and they immediately retreated. This was the first battle I ever saw where men in anger met men in earnest. We were now perfectly safe; our Manilla men were brave as Cæsar; they were anxious to be landed instantly, to fight these Indians at once. They felt as much superior, no doubt, to these ignorant savages, as the philosopher does to the peasant. This the captain would not permit; he knew his superiority while on board his vessel, and he also knew, that this superiority must be, in a manner, lost to him as soon as he landed.

The firing had ceased and the enemy had retired, when a single canoe appeared coming from the shore with one man in it. We could not conjecture what this could mean. The man was as naked as a savage and as highly painted, but he managed his paddle with a different hand from the savages. When he came alongside, he spoke to us in English, and we recognised LEONARD SHAW, one of our old crew, whom we supposed among the dead. The meeting had that joyousness about it that cannot be felt in ordinary life; he was dead and buried, and now was alive again! We received him as one might imagine; surprise, joy, wonder, took possession of us all, and we made him recount his adventures, which were wonderful enough.

Shaw was wounded when the others were slain; he fled to the woods, and succeeded at that time in escaping from death. Hunger at length induced him to leave the woods and attempt to give himself up to the savages, but coming in

sight of the horrid spectacle of the bodies of his friends and companions roasting for a cannibal feast, he rushed again into the woods with the intent rather to starve than to trust to such wretches for protection. For four days and nights he remained in his hiding-place, when he was forced to go in pursuit of something to keep himself from starving. After some exertion, he obtained three cocoanuts, which were so young that they did not afford much sustenance, but were sufficient to keep him alive fifteen days, during which time he suffered from the continually falling showers, which left him dripping wet. In the shade of his hiding-place he had no chance to dry himself, and on the fifteenth day he ventured to stretch himself in the sun; but he did not remain long undisturbed; an Indian saw him and gave the alarm, and he was at once surrounded by a host of the savages. The poor suffering wretch implored them to be merciful, but he implored in vain; one of them struck him on the back of the head with a war-club and laid him senseless upon the ground, and for a while left him as dead. When he recovered, and had gathered his scattered senses, he observed a chief who was not among those by whom he had been attacked, and made signs to him that he would be his slave if he would save him. The savage intimated to him to follow, which he did, and had his wound most cruelly dressed by the savage, who poured hot water into it, and filled it with sand.

As soon as the next day, while yet in agony with his wound, he was called up and set to work in making knives and other implements from the iron hoops and other plunder from the

forge when the massacre took place. This was indeed hard, for the poor fellow was no mechanic, though a first-rate jack tar, and had never laboured much out of his profession ; however, necessity made him a blacksmith, and he got along pretty well.

The savages were not yet satisfied, and they made him march five or six miles to visit a distinguished chief. This was done in a state of nudity, without any thing like sandals or moccasins to protect his feet from the flint-stones and sharp shells, and under the burning rays of an intolerable sun. Blood marked his footsteps. The king met him, and compelled him to debase himself by the most abject ceremonies of slavery. He was now overcome, and with a dogged indifference was ready to die. He could not, he would not walk back ; his feet were lacerated, swollen, and almost in a state of putrefaction. The savages saw this, and took him back by water, but only to experience new torments. The young ones imitated their elders, and these graceless little rascals pulled out his beard and whiskers, and eyebrows and eyelashes. In order to save himself some part of the pain of this wretched process of their amusement, he was permitted to perform a part of this work with his own hands ! He was indeed a pitiable object, but one cannot die when one wishes, and be guiltless. This was not all he suffered ; he was almost starved to death, for they gave him only the offal of the fish they caught, and this but sparingly ; he sustained himself by catching rats, and these offensive creatures were his principal food for a long time. He understood that the natives did not suffer the rats to be killed, and therefore he had to do it secretly in the night-time.

Thus passed the days of the prisoner ; the head of the poor fellow not yet healed, notwithstanding all his efforts to get the sand out of his wound, until a short time before his deliverance, when it was made known to him that he was to be immolated for a feast to the king of the group ! All things had now become matters of indifference to him, and he heard the horrid story with great composure. All the preparations for the sacrifice were got up in his presence, near the very spot where the accursed feast of skulls had been held. All was in readiness, and waited a long time for the king ; but he did not come, and the ceremony was put off. Shaw has often expressed himself fully on this subject, and said that he could not but feel some regret that his woes were not to be finished, as there was no hope for him, and to linger always in this state of agitation was worse than death ; but mortals are short-sighted, for he was destined to be saved through the instrumentality of his friends.

His soul was again agitated by hope and fear, in the extremes, on the day when the Antarctic made her appearance a second time on the coast. He feared that her arrival would be the signal for his destruction ; but if this should not happen, might he not be saved ? The whole population of the island he was on, and those of the others of the group, manned their war-canoes for a formidable attack, and the fate of the prisoner was suspended for a season. The attack was commenced by the warriors in the canoes, without doubt confident of success ; but the well-directed fire from the Antarctic soon repulsed them, and they sought the shore in paroxysms of rage, which was changed to fear when they found that

the big guns of the schooner threw their shot directly into the village, and were rapidly demolishing their dwellings. It was in this state of fear and humility that Shaw was sent off to the vessel to stop the carnage and destruction; they were glad to have peace on any terms. They now gave up their boldness, and as it was the wish of all but the Manilla men to spare the effusion of human blood, it was done as soon as safety would admit of it.

The story of Shaw's sufferings raised the indignation of every one of the Americans and English we had on board, and they were violently desirous to be led on to attack the whole of Massacre Island, and extirpate the race at once. They felt at this moment as if it would be an easy thing to kill the whole of them; but Capt. Morrell was not to be governed by any impulse of passion—he had other duties to perform; yet he did not reprimand the men for this feeling, thinking it might be of service to him hereafter.

After taking every precaution to secure safety, by getting up his boarding nettings many feet above the deck, and every thing prepared for defence or attack, the frame of a house, brought for the purpose, was got up on a small uninhabited island,—which had been purchased of the king in exchange for useful articles, such as axes, shaves, and other mechanical tools, precisely such as the Indians wished for. The captain landed with a large force, and began to fell the trees to make a castle for defence. Finding two large trees, nearly six feet through, he prepared the limbs about forty feet from the ground, and raised a platform extending from one to the other, with an arrow-proof bulwark around it. Upon this

platform were stationed a garrison of twenty men, with four brass swivels. This platform was covered with a water-tight roof, and the men slept there at night upon their arms, to keep the natives from approaching to injure the trees or fort by fire, the only way they could assail the garrison. It looked indeed like a castle—formidable in every respect; and the ascent to it was by a ladder, which was drawn up at night into the warlike habitation. The next step was to clear the woods from around the castle, in order to prevent a lurking enemy from coming within arrow-shot of the fort. Next the house was raised, and made quite a fine appearance, being one hundred and fifty feet long, forty feet broad, and very high. The castle protected the house and the workmen in it, and both house and castle were so near the sea-board that the Antarctic, while riding at anchor, protected both. The castle was well stocked with provisions in case of a siege.

The next day, after all was in order for business, a large number of canoes made their appearance near Massacre Island. Shaw said that this fleet belonged to another island, and he had never known them to stop there before. My husband, having some suspicions, did not suffer the crew to go ashore the next morning at the usual time; and about eight o'clock one of the chiefs came off, as usual, to offer us fruits, but no boat was sent to meet him. He waited some time for us and then directed his course to our island, which my husband had named Wallace Island, in memory of the officer who had bravely fallen in fight on the day of the massacre. This was surprising, as not a single native had set a foot on that island since our works were begun; but we were not

kept long in suspense, for we saw about a hundred war-canoes start from the back side of Massacre Island and make towards Wallace Island. We knew that war was their object, and the Antarctic was prepared for battle. The chief who came to sell us fruits, landed in front of the castle, the first man. He gave the warhoop, and about two hundred warriors, who had concealed themselves in the woods during the darkness of the night, rushed forward. The castle was attacked on both sides, and the Indians discharged their arrows at the building in the air, till they were stuck, like porcupine's quills, in every part of the roof. The garrison was firm, and waited in silence until the assailants were within a short distance, when they opened a tremendous fire from their swivels, loaded with canister shot; the men were ready with their muskets also, and the Antarctic opened her fire of large guns, all with a direct and deadly aim at the leaders of the savage band. The execution was very great, and in a short time the enemy made a precipitate retreat, taking with them their wounded and as many of their dead as they could. The ground was strewed with implements of war, which the savages had thrown away in their flight, or which had belonged to the slain. The enemy did not expect such a reception, and they were prodigiously frightened; the sound of the cannon alarmed every woman and child in the group as it echoed through the forest or died upon the wave; they had never heard such a roar before, for in our first fight there was no necessity for such energy. The Indians took to the water, leaving only a few in their canoes, to get them off, while the garrison hoisted the American flag, and were greeted by

those on board of the schooner, who were in high spirits at their victory, which was achieved without the loss of a man on our part, and only two wounded. The music struck up "Yankee Doodle," "Rule Britannia," &c., and the crew could hardly restrain their joy to think they had beaten their enemy so easily.

The boats were all manned, and most of the crew went on shore to mark the devastation which had been made. I saw all this without any sensation of fear, so easy is it for a woman to catch the spirit of those near her. If I had, a few months before this time, read of such a battle, I should have trembled at the detail of the incidents; but seeing all the animation and courage which were displayed, and noticing, at the same time, how coolly all was done, every particle of fear left me, and I stood quite as collected as any heroine of former days. Still I could not but deplore the sacrifice of the poor, misguided, ignorant creatures, who wore the human form, and had souls to save. Must the ignorant always be taught civilization through blood?—situated as we were, no other course could be taken.

We now went on finishing our house and clearing more of the woods. Our wounded were taken on board, and had their wounds dressed: they were not of an alarming nature, although at first we were apprehensive that the arrows might have been poisoned; but they were not, and the men soon recovered.

On the morning of the 19th, to our great surprise, the chief who had previously come out to bring us fruit, and had done so on the morning of our great battle, came again in his canoe and called for Shaw, on the edge of the reef, with his

usual air of kindness and friendship, offering fruit, and intimating a desire for trade, as though nothing had happened. The offer seemed fair, but all believed him to be treacherous. The small boat was sent to meet him, but Shaw, who we feared was now an object of vengeance, was not sent in her. She was armed for fear of the worst, and the cockswain of the boat had orders to kill the chief if he should discover any treachery in him. As our boat came alongside the canoe, the crew saw a bearded arrow attached to a bow ready for the purpose of revenge. Just as the savage was about to bend his bow, the cockswain levelled his piece, and shot the traitor through the body; his wound was mortal, but he did not expire immediately. At this instant a fleet of canoes made their appearance to protect their chief. The small boat lost one of her oars in the fight, and we were obliged to man two large boats and send them to the place of contest. The large boats were armed with swivels and muskets, and a furious engagement ensued. The natives were driven from the water, but succeeded in taking off their wounded chief, who expired as he reached the shore.

After the death of *Henmean*, the name of the chief we had slain, the inhabitants of Massacre Island fled to some other place, and left all things as they were before our attack upon them, and our men roamed over it at will. The skulls of several of our slaughtered men were found at *Henmean's* door, trophies of his bloody prowess. These were now buried with the honours of war; the colours of the Antarctic were lowered half-mast, minute-guns were fired, and dirges were played by our band, in honour of those who

had fallen untimely on Massacre Island. This was all that feeling or affection could bestow. Those so inhumanly murdered had at last the rites of burial performed for them: millions have perished without such honours. It seems to be a passion of every age and nation, of every religious creed under the sun, to have funeral rites performed over their dead bodies. This love of posthumous honours is deeply ingrafted into our systems, if it is not implanted there by nature: it is the last sad office that can be paid; and though last, not least.

We now commenced collecting and curing biche-de-mer, and should have succeeded to our wishes, if we had not been continually harassed by the natives as soon as we began our efforts. We continued to work in this way until the 28th of October, when we found that the natives were still hostile, and on that day one of our men was attacked on Massacre Island, but escaped death through great presence of mind, and shot the brother of the chief Hennean; this man's name was THOMAS HOLMES, a cool, deliberate Englishman. Such an instance of self-possession, in such great danger as that in which he was placed, would have given immortality to a greater man. We felt ourselves much harassed and vexed by the persevering savages, and finding it impossible to make them understand our motives and intentions, we came to the conclusion to leave the place forthwith. This was painful, after such struggles and sacrifices and misfortunes; but there was no other course to pursue. Accordingly, on the 3d of November, 1830, we set fire to our house and castle, and departed by the light of them, taking the biche-de-mer we had collected

and cured. If we had been left to pursue our course without molestation, there can be no doubt but that a fine voyage would have been made; for in no place is the article better or more abundant.

We left this place for Bouka Island, where we soon arrived. The manners and customs of the people here are the same as those at the Massacre Islands; but they have more formidable canoes, of better construction, and they move swifter through the water. It is not a little surprising, that in such a short distance, better canoes—the whole of their ingenuity in ship-building—should be found than at the Massacre Islands. Between these islands we found large quantities of sperm-whale, as tame as kittens; probably no harpoon had ever been thrown at them since the art of whaling has been known. All on board thought that at certain seasons this might be good whaling ground; but those who visit these seas must be cautious how they expose themselves for an instant, as the savages are so powerful and treacherous. This island abounds in biche-de-mer and sandal-wood; and if these people could be trusted, a good voyage, it is thought, could be made here.

Nature, the kind mother and nurse to all her children, seems to have been very provident to these islanders of the Southern as well as to those of the Western Pacific, particularly in giving them the bread-fruit tree, as it is called by Europeans. It grows wild on almost all the islands of the Pacific, within thirty degrees of the equator, but is in perfection from the tenth to the twentieth. It is a tall tree, about fifty feet in height, with spreading branches and large leaves, and makes

an excellent shelter in the heat of the day. It bears fruit for three-quarters of the year in most places, and near the equator longer than that time. The bread-fruit is a large round fruit, about as big as a common ostrich's egg. The pulp is the only part eaten, and this not raw. The fruit is generally cut into several pieces, wrapped up in an envelope of the leaf of the same tree, and put into ground which has been heated, or among embers, and there made to roast for half an hour. It has the appearance of the potato, with a slight taste of the tomato. These cooks of nature understand mixing with this roasted fruit the milk of the cocoanut and a great many other vegetables, all of which it is impossible distinctly to understand, either from seeing them prepare it, or from their description of the preparation. The same quantity of this food is more nutritious than either the plantain or bananas alone, and much preferred by the natives. A few trees supply a family; but these are not all the uses of this tree. The inner bark is fibrous, and of this some of the natives make cloth, fishing-lines, &c., and the wood is good for making canoes. The wood is as soft, or softer than our white-pine or bass, when green, but grows hard by being thoroughly seasoned. It is not easily corrupted; like the sycamore, it will last many years without decaying. This tree has been brought from the Pacific to the West Indies, and flourishes well there; but the Africans in slavery lose their taste for natural food in a great measure, and prefer the maize to bread-fruit, and of course the cultivation of it is not much encouraged.

CHAPTER IV.

St. George's Channel—Beauty of the Scenery—Birds of New-Britain—Natural Society—Warlike Instruments of the Natives—Island of Papua—Birds of Paradise—Volcanic Islands—New Discoveries—Hostilities of the Natives—Productions of these Islands—Ambergris—Return to Manila.

WE now shaped our course for New-Ireland, and continued our way through St. George's Channel, which is formed by the west side of New-Ireland and the east side of New-Britain. This channel is safe, or it seemed so to us at least, and has been described as one of the most beautiful on the globe; and I think it is. The hills on each side are lofty, and the descent to the sea is gentle and regular. The forests are of the most massy growth, and greatly diversified by various kinds of trees, intermingled with luxuriant flowers and fruit trees. The air, as you sail along in a fine day, is aromatic with the nutmeg and other spicy groves. These islands are said to be not only abounding in the productions of nature, but capable of raising almost every thing in the known world. The biche-de-mer, hawk-bill tortoise-shell, red coral, ambergris, and no doubt many other things, are found here, such as pearl-shell and sandal-wood; for it seems to be a law of nature, that where she shows her kindnesses she outpours them in great abundance. The natives visited us, bringing plenty of fruits and fowls, which we purchased for a few pieces

of iron hoops and some trinkets. Few people that I have seen are better formed than these islanders; they are dark, stout built, and are susceptible of becoming the most civilized in the Eastern world, I should think. In the course of the day we had ample opportunity to form an opinion of them; and after a short time one gets into a habit of forming more correct opinions in an hour than could be made up in a day, when first launched into a world of wonders.

We landed on New-Britain, and found a great variety of birds, some of beautiful plumage, and others of most melodious notes. Hogs and dogs are also found here, and are plentiful to a great extent. The fish are remarkably fine around the island. In fine, these people seemed to me to be the happiest of all the race of wild men I had ever seen. It is amusing to think how soon we become enamoured with the thought of natural society, and in moments of contemplation wish to be found among people of a primitive cast. The thousand evils of social life crowd upon us when we look at these forests and their inhabitants; there is no vulgar wretchedness, as seen in crowded cities—no squalid diseases; there is nothing of aristocratic contumely, and the laws of nature are only slightly regulated by convention or necessity.

From here we sailed to examine the north cape of New-Britain. We were visited by the inhabitants, who seemed of a much more savage nature than those of New-Ireland. The shores are surrounded with coral reefs, about eight or ten miles from them. Arrowsmith's charts, my husband said, were pretty correct; but he regretted very much that he could not spare time to give

a more correct one. It is wonderful to me that they are so correct as we find them, so little time could be bestowed upon the subject. We continued to keep near the shore for some time, having now and then a little difficulty with the natives; for they thought our vessel so small that a crew of one or two canoes would take her with ease; we had only to splash the water about them, however, with a cannon shot or two, to make them keep at a fearful distance. There is something terrible to a savage ear in the sound of big guns, and I know not whose ear ever gets familiar to the roar of a full-mouthed battery. I must confess, though I thought myself quite brave, that I always trembled a little to hear a great gun fired, and to feel the tremulous motion of the ship at its recoil. Fortunately we were not obliged to sacrifice any of the natives for our safety, as we could get along without proceeding to such extremities. Half the blood that has been spilt in the world might have been avoided by prudence and moral reflection. The natives often act from ignorance, and a natural love of gain or power; and the civilized man turns his rage upon the poor wretches, as if they were as able to reason as an enlightened European. If we had a hold on their affections, I have no doubt that we should find them strong and permanent; for they have but few conventional reasons to break in upon a course of nature, and as far as I have watched the operations of nature, the savage loves his offspring as much as civilized man. But it is in vain to moralize, for this will not change habits, manners, or morals. Oh! for that blessed day when civilization, attended by all the Christian virtues, shall reach the isles of

the sea, and make glad all the nations of the earth. I am no enthusiast ; but when I see what has been done at New-Zealand, I do not despair, in my time, of hearing that these very places I have attempted faintly to describe have felt the benign influences of our holy religion.

We crossed the straits, and came close under the northern shore of an island, which lies nearly in the centre of the strait. It is of some size, and my husband called it Dampier's Island, in honour of the discoverer of it. The natives came off to see us, and were very cautious ; but by coaxing them with the show of trinkets, we got them alongside. While with us, they discovered more than ordinary curiosity, for savages ; they examined every thing about the vessel, were curious to know the uses of the chain cables and anchors, the great guns, and every thing on board. They offered us various articles, which we purchased, such as fishing gear, spears, war-clubs, and pearl-shells ; as also some of their household implements, such as knives and other instruments made of pearl-shell, and of no ordinary workmanship. They presented us some elegant spears, with pearl-shell heads, and ornamented in fine style with carving and feathers of the birds of paradise. The wooden part of these spears is of excellent heavy dark wood, resembling ebony ; and the carving upon them is often really curious, and bespeaks an advance in the arts hardly believed to exist in savage life. It would not be saying enough to call them ingenious ; they are tasteful. It is astonishing to those who think all barbarous nations are only on an equality, in the arts, with our North American Indians, to witness such specimens

of skill in carving and ornamenting their works of war, or of taste. The villages of these islanders are laid out upon the sides of the hills, and their dwellings are shaded by the lofty cocoanut and bread-fruit trees. They seem to live happily among themselves, and to enjoy every hour of their existence; and as far as I am able to judge, the extent of human life is as great in these climates as in any part of the world. I saw no victims of disease, nor any instances of decrepitude.

On the 12th of November we left Dampier's Island, with fair weather and a fine breeze. We sailed at the rate of thirteen miles an hour, assisted by the current, and soon reached the north of Long Island, which is less elevated than the one we had just left. We saw only a few wigwams along the shore, and some natives; but we could not conveniently land, and kept on our course until we had passed the western end of Long Island, and thence proceeded to the coast of New-Guinea.

All these seas are dangerous, by reason of the coral reefs, and navigators should be on their guard, as they are liable to be suddenly run upon. The mariner is not much assisted by soundings, for these reefs arise from deep water, thrown up by volcanic power, and come from the depths of the ocean.

We now reached De Kay's Bay, the entrance to which is in latitude $5^{\circ} 39'$ south, and longitude $146^{\circ} 2'$ east. The villages around these shores are numerous and pleasant. The natives have the negro cast of features, and they are shrewd, although their appearance is as savage as well could be. They are not in person like the negro, for they are well formed in their limbs;

but no one, on looking at them, could confide in them for an instant. Their instruments of war make them formidable. They are expert in the use of the bow, and send their arrows with great directness and force. They are extremely adroit in catching fish, which is a considerable part of their employment.

The heads of the natives are decorated with the plumage of the bird of paradise, of many species. We saw many flocks of these birds soaring high above the water; they float along as a tuft of feathers. They are of all sizes, from that of a pigeon to the diminutive form of a sparrow. The noise they make in the air is not at all melodious; it is a sort of chattering, without a distinct note. They look splendid in the sun, and some of the most diminutive are not the least beautiful. Fancy has given these birds properties which nature never did; but nothing can look more beautiful than they do when floating along with all the colours of the rainbow in the rays of the sun. They have such an abundance of feathers compared to their corporeal weight, that it is easy for them to keep on the wing; and therefore the fabulist and romantic have made them live for ever in flight; but reason and examination have proved this false. It is certain, I believe, that they flourish only near the equator, and cannot endure the slightest chill. They live among flowers and sandal-wood. Delicate things of nature are generally grouped together.

The race of men, however, must make an exception to this rule. Whatever pride may say, or think, the beauties of nature in the wilds of the world were made without any regard to proud

man, for nature often revels in beauties, and unveils her charms to the most ecstatic extent, where man is ignorant and savage; and man is often greatest where nature is sterile and iron-bound. No bird of paradise ever spread his wings on the hills of North America, or on the mountains of Switzerland or Scotland, where man has reached the highest moral and intellectual perfection. And even when civilized man takes possession of the bowers of Eden, he does not suffer the original features of nature to remain, but sacrifices every grace and beauty to the rigid laws of utility and productiveness. The most lovely streams in our own country, adorned with dashing falls and pure water, are not suffered to run on in their natural course, but are stopped and tortured to turn a mill-wheel, or dammed up to move off obliquely and fill a canal. The aborigines look with pity on these tasteless occupants of their soil, and sigh to think that power and prosperity do not suffer the lovely face of nature to remain as it was in the days of their fathers. But utility should be paramount to taste in a world whose object is gain.

On Saturday, the 13th of November, we kept the mainland close on board of us, being obliged to sheer off sometimes to clear the coral reefs. In the afternoon we were close to a headland that seemed hanging over the sea. Between this and the seashore, however, there were many huts of the natives in the midst of beautiful groves of cocoanut-trees. My husband told me to put the name of this cape, which is in latitude $4^{\circ} 59'$ south, and longitude $145^{\circ} 16'$ east, in my journal as Cape Livingston, in honour of Edward Livingston, Esq., Secretary of State.

About six leagues from the cape, N.N.E., lies a small volcanic island. At night the prospect was indeed sublime; the flames were bursting from the crater, and ascending much higher than those of *Ætna* or *Vesuvius*, as those bursts of smoke and fire have been described to us. The flames reached at least, as I had been taught to measure distances with my eye since I had been on the voyage, a thousand feet in height. It was as light as if ten thousand lamps were suspended over our deck; and the stones cast up appeared like myriads of red-hot shot thrown in the night at incalculable distances. I gazed on this scene as one of wonderful sublimity, and thought how impotent language was to convey a full and competent idea of it. The next day, following the course of the island of *Papua*, we passed six other volcanic islands, all of which were in full blast.

What a scene for the poet! If those of antiquity roused all their energies and exhausted their powers of language on *Ætna*, whose fires were almost burnt out when they wrote, how would they have communicated to the world their impressions of these numerous mountains of infernal smoke and fire, which seemed, as it were, in the first stage of their wrath! How small seems the power of man, when we contemplate these wonders of nature, and ask for what uses they were formed! After the wonder has passed over us, we begin to see their uses; they are the engines of the Almighty in planting islands in the midst of the seas. By volcanic power masses of the bottom of the ocean are thrown up, the lava is spread abroad to a greater or less extent, and on its surface a soil is formed; and by some inscrutable law of nature trees grow

up, birds and animals are found upon it, and man, self-wise man, wonders and puzzles his head to tell why all this is, and makes a thousand fanciful conjectures upon what he calls the philosophy of the matter, and talks learnedly upon the nature of things. But after all, he knows but little about it. Although in our common course of life, in the midst of society, we know, when we reason, that God is everywhere, yet we see so much of the works of man that there is a sort of belief in our minds that man has much to do with all affairs in this world, and seems to divide the empire of it with its Creator. But on the wide-spread ocean, where nature is every thing, and man nothing, we enter, as it were, the depths of Omnipotence, and adore his majesty and power as the Being who said, and still says, in the burning mountain as in the burning bush, I AM that I AM; and who is there then that would not turn aside to see this great sight ?

My husband named this promontory Woodbury's Cape, in honour of the then Chairman of Naval affairs in Congress, now Secretary of the Navy of the United States. Five miles from the cape is a fine spacious harbour, of sufficient depth of water between the rocks, but the course is narrow and winding.

The next day, November 15th, we passed another headland, which was called Cape Decatur, in honour of Capt. Stephen Decatur, formerly of the United States' navy. This day and the following we were visited by many of the natives, but were cautious of them, as we had suffered so much from their treachery.

We fell in with numerous islands, but I do not recollect that my husband gave them a name, or

that they had already had one given them. They lie low, and are surrounded by a coral reef. Here there is plenty of biche-de-mer, pearls, tortoise, and oysters. Of this place I had neither latitude nor longitude given me, and I have never inquired the cause, but I could easily conjecture it. From these islands the natives came off to us in great numbers in large canoes. They made an attempt to get us on the coral reef, by making their canoes fast to the schooner and paddling towards the shore; but the wind being brisk, they could not make any headway. Their lines soon parted, and in their rage they shot their arrows at the schooner. A few guns were fired over their heads to frighten them, and make them understand the power of those they attempted to assail. The report of the cannon astounded them, and many leaped into the sea for safety. We had already had enough of blood, and were unwilling to shed it. A boat was lowered while they were in confusion, and one of the natives picked up. We took him for the purpose of educating him, by giving him an opportunity of seeing civilization, and then returning him to his native country. After we had taken our prisoner, they made the best of their way to the shore. These islands are all thickly wooded; the cocoanut-trees are lofty and fruitful, and as large as any I ever saw, and bread-fruit trees are in great profusion. The natives dress with coral necklaces, feathers in their hair, and numerous other ornaments, which give them quite a stylish appearance. Tortoise-shell and mother-of-pearl are profuse in these ornaments, and they bear marks of opulence in all those things which we think of importance. Their dress is nothing more than an apron about their loins, formed of several kinds of materials,

as they can afford, according to their rank. These natives are well formed and muscular, and their features are manly; they are unlike any other tribe in these seas. There are one or two passages through the reefs, and after getting within them you find good anchorage.

While here, my husband purchased several pieces of *ambergris* of the natives. I examined this wonderful substance very attentively. Its colour is a darkish yellow, resembling very closely a mass of bees-wax. It had insects and beaks of birds in it, and burned very clear, as much so as bees-wax. When rubbed, it emits a perfume generally much admired. It was taken from the water, on which it was floating, about one-third of it above the surface. Numerous accounts have been given of its nature and origin. It has been said that it grows in the intestines of the sperm-ceti whale. It is true that it is often found in the whale, but generally in those that are poor and unhealthy. The whalers, I find, have a general impression that it originates there from the feeding of the whale on certain fish called squids. The orientals, however, had no such idea of its origin; they considered it as a sea mushroom, which, growing on the bottom of the sea, was by time or accident rooted up, and coming to the surface grew harder by partial exposure to the sun. Others say that it grows on the rocks, and is washed off in storms and driven near the islands, where it is picked up by the natives. Some suppose it is wax, or a honey-comb, which, by dropping into the sea, undergoes a chymical change; while some contend that it is a bituminous matter, that comes from the bottom of the sea. There are not a few who think that it is the

excrement of certain fish ; but the poets of the East say that it is a gum from the tears of certain consecrated sea-birds.

“ Around thee shall glisten the loveliest *amber*
That ever the sorrowing sea-bird hath wept,
And many a shell in whose hollow-wreathed chamber
We Peris of ocean by moonlight have slept.”

Whatever may be its origin or creation, it certainly has for many centuries been held in high estimation as a perfume and for ornaments, and its use has generally been confined to the rich and powerful. Large pieces of it have lately been found, and when we consider the purposes for which it has been used,—particularly as a perfume,—the price of it is astonishing. My husband, who has been much in these seas, and often made it a matter of traffic, is of opinion that the natives of these islands have a correct idea of the substance ; viz. that it is made by an insect at the bottom of the sea, and accumulates for years ; and that sea-birds devour it when within their reach, which accounts for their bills being found in it. The birds, being attracted by its glutinous qualities, strike their beaks too deep to extricate themselves, and their bodies decay, while the bony parts of their beaks remain. The sperm-whale is a ravenous animal, and he may root it up and swallow it ; and this, perhaps, is one mode by which the God of nature intended that the leviathan of the ocean should be destroyed. That it is formed in the whale seems unnatural in many respects ; the places, too, where it is found in the most abundance, do not abound in sperm-whales, and I have never read that it was found in any other kinds of whales.

There is no accounting for the arbitrary laws of fashion; once a man of fashion in England, and in most cities on the Continent, must have an amber-headed cane, if he carried one at all. Gay, in his *Trivia*, alludes to this matter of fashion:—

“If the strong cane support thy walking hand,
Chairmen no longer shall the wall command;
Even sturdy carmen shall thy nod obey,
And rattling coaches stop to make thee way.
This shall direct thy cautious tread aright,
Though not one glaring lamp enliven night.
Let beaux their canes, with *amber tipp'd*, produce,
Be theirs for empty show, but thine for use.”

Since the days of the rage for tulips in Holland, and their high prices, there has not been a more decidedly mere creature of fashionable imagination than that of a partiality among the rich for amber, whether dug from the mines, or found in another form floating upon the water, or torn from the murdered whale. It is, perhaps, the only way that commerce can be sustained, to supply the whims of the opulent as well as the honest wants of the community: the artificial wants of society support a great proportion of the people of every country.

We left these islands with a fine breeze, and soon found ourselves near another one, low and uninhabited, and within a coral reef. Not far from this we discovered another island not laid down on any chart we had on board. Here we were visited by the natives, and found them, like most of these aborigines, dangerous to deal with. These groups are thinly inhabited. I am fully of opinion that numerous islands, containing articles of valuable commerce, are still to be found

in these seas; it cannot be that half of them are yet discovered.

On the 26th of November we took the trade-winds in latitude $6^{\circ} 0'$, and longitude $144^{\circ} 55'$, and between this and New-Britain we discovered the islands from which we took two natives, whom my husband named SUNDAY and MONDAY. On the 27th we crossed a coral reef of several miles in circumference, with from three to ten fathoms of water on it. From hence we steered for the St. Bernardino, which we entered on the 9th of December, and the next day touched at Port of Santa Sinto, and took in a supply of provisions, of which we were in great want, as we had been on short allowance for many days, which I feared would create some disturbance on board; but when the sailors and Manilla men saw that we in the cabin were on allowance also, they were kept quiet as lambs—so easy is it to govern others when we can govern ourselves. During our whole cruise from Manilla we had no sickness, or none to speak of,—one man only requiring medicine. This was effected, in these warm and often sickly climes, by keeping all in a state of cleanliness, without the use of ardent spirits, and never suffering the crew, in any case, to be long idle. Vinegar is an excellent thing for keeping a vessel sweet, and we used it freely.

We now made the best of our way to Manilla, and reached there on Thursday, the 14th of December, after an absence of about six months. The crew had behaved well, no punishment having been required during the whole voyage. All were treated well, and all behaved well; I went to sleep as quietly as if I had been in my native

city, and was, in fact, as secure ; so much is there in a spirit of government. I have sometimes thought that tigers and lions might be tamed, if they were perfectly governed. On our arrival at Manilla, as I apprehended, we found that our evils were not at an end. Our English and Spanish friends were as kind as people could be ; still the consul continued his persecutions.

CHAPTER V.

Stay at Manila—Visit to Convents and Churches—Spanish Ladies—Sketch of the History of the Philippine Islands—Earthquake—Appearance of the People after the Earthquake—Sketch of La Perouse's Voyages—Kotzebue—Captain Cook—Ledyard—American Whaling-ships—Their Voyages—Their Discoveries—Leaving Manila—Arrival at Singapore—Description of the Island—Tour to the Mountains—Ladies of Singapore—Singing-birds—Farewell to Singapore—Hospitality of the People—Horsburgh's Directory—Malays—Trade-winds—Isle of France and Madagascar—Mrs. Harriet Newell—Mrs. Judson—Missionaries—Luminous Appearance of the Sea—Sea and Land compared—Dr. Mitchill—Captain Gates.

AFTER staying here nearly a month, we were ready, and sailed on the 13th of January, 1831. It was hard parting with some of our friends, who had been so kind to us in our difficulties. Every heart responds to the old adage, "a friend in need is a friend indeed;" and distance from home, too, enhances every kindness, as it redoubles every insult. I have found friends fifteen thousand miles from my native land, and these among strangers; while our troubles came from one of our own countrymen. Our government should be cautious what sort of men they send abroad; the people among whom they reside judge the whole nation from its representatives. I know this is not correct; but they will so reason in most cases, and it is natural that they should. For my own part, I expected friendship from my countrymen wherever they were to be met with

abroad, and I hope no one has been so unfortunate as I have. But I have said enough upon this subject, perhaps too much; yet it pressed so grievously upon my heart that I could not be silent, and feel satisfied. I wished the world to know my sufferings; their recital may serve a good purpose by putting others on their guard.

While in Manilla I visited several churches and one of the convents. The churches are like those of Old Spain, built about three centuries ago. The light in these gothic temples is softened, and the whole appearance is that of solemn grandeur. To a Protestant there seems to be too much pomp and circumstance in the Catholic worship; but if one can get rid of this impression upon his mind, the ceremonies are imposing. The Scripture pieces that ornament these churches are not so numerous as I expected to find them, but some of them are said to be from the hands of the great masters of Italy and Spain. I was at first inclined to think that paintings in churches were out of place, however solemn and scriptural the subjects; but I soon became pleased with examining them as works of art, and at times thought they made wholesome impressions on my mind in moments of devotion. These large paintings look better while the organ, with its swelling peals, is raising the soul to heaven by the divinity of music.

I must confess, too, that my impressions of a convent were not quite correct. I had only known them as represented in novels, the prison-houses of beautiful girls, thrust there by proud or hard-hearted parents, never to catch a glimpse of the world except through a grate of iron. My visits to this cloister convinced me of one

thing I never dreamed of before ; which was, that a woman may be a nun, even if she be old and ugly too. A great proportion of the women that I saw in this convent were solemn, staid, and old : now and then a young and handsome girl was seen among them ; but then she bore no marks of misery about her, but seemed composed, softened, and meditative, without any haggardness from weeping her soul away. They all seemed full of occupation ; some were making clothes for the poor, while others were engaged in embroidering and painting. Every thing that came from their hands had a nicety and delicacy about it as if wrought by fairy fingers. There is no idleness in these convents, as is generally supposed ; their devotions begin at the dawn of the day, and are often repeated during the whole of it, or until late in the evening, in some form or other. But after all, their lives are not more monotonous than that of most women in many parts of the world, where all the change in their lives, except such as age makes, as the Vicar of Wakefield says, is from the blue bed to the brown. The Spanish women are well formed, though not possessing that extreme delicacy and refinement which are often, in our own country, considered as being necessary to exquisite beauty. They have no small share of health and strength in their beauty ; nor can their complexions be compared with the English or American ladies for whiteness and brilliancy ; but there is a warmth of colouring in them that gives a sweet animation to their countenances, whenever they are engaged in conversation ; and no eye can be finer than that of the Spanish lady's. They are kind-hearted, and if ever vindictive, as they are repre-

tented to be, it is from "love to hatred turned" by some insult or neglect. The Spanish ladies are not wanting in high heroic bravery; I can readily believe all that was said of their heroism at Saragossa. They love liberty and independence, in their own way, as much as any women I know of. They dress well, in their own style; their clothes are rich and splendid, but they do not affect the French or English fashions. I have seen some most splendid dresses at a ball given by the governor's lady; and there is a fine elastic step in the dance of the Spanish lady which is at once graceful, modest, and elegant.

Some of the Spanish at Manilla are as near the days of Philip II. in their manners and customs as some of our Canadian friends are to those of Louis XIV. There is the Moorish loftiness often seen among those in humble stations; and the Spaniard is a good subject. He is loyal to his king, shows no restlessness, lives frugally, and is content with what he has. He is quick and sensitive, but neither captious nor quarrelsome in his general intercourse with society; but terrible in his resentments from wounded honour. The stories of gallantries and assassinations are now and then true, but there have not been a hundredth part so many of these things as have been represented by the English and the French. England, from the days of Queen Mary, has had no good-will towards Spain; and since her time, there has been no connexion by marriage between the royal families of these kingdoms. England, on becoming Protestant, was obliged to seek alliances in Protestant Germany, and there had been no real friendship between these nations from the divorce of Catharine to the time when England

fought France in Spain, under Sir John Moore and others; and then it was rather a union of purpose than of feeling. Spain had been plundered by French and English bucaniers, from 1669 to 1730, and the two nations took no great pains to extirpate this formidable race of freebooters, until they began to rob and plunder their own ships. Almost every thing we have had of the history of the Spaniards has come through English writers.

As far as I could judge, the style of ordinary conversation is less familiar and colloquial among the Spaniards than among us. Some of the ladies in Manilla, from having Chinese domestics, have become in some measure acquainted with the Chinese language, and made some proficiency in writing it. They say that no people abound more in romantic tales than the Chinese; that even the common people, who have but little erudition, have numerous tales of wonder to communicate for the pleasure of the circle to which they belong. I believe every nation has its region of fiction and story-tellers, except our own, and we began our national existence with too much accurate knowledge to be under the necessity of having recourse to fiction. The Tartars have less refinement than the Chinese, but as much force of character, with less industry and economy. The distinguishing traits of character between the two nations, although they are ranked with each other, are prominent, both physically and morally.

During my residence in Manilla I witnessed one of those terrors of nations, an earthquake. I was not so much alarmed as I thought I should be. Courage is a virtue which is generally ac-

quired by the necessity of braving dangers ; and after the dread of storms and sickness at sea, I did not feel much alarmed at other things, even such as would, if they had overtaken me before my voyage, have shaken me like a leaf. The first thing that struck me was the appearance of people in the street kneeling and saying their prayers wherever they could see a crucifix, or an image of the Blessed Virgin. The Chinese was looking around with his little twinkling eye, half-amazed, yet unwilling to retire from the scene of business while any remained to buy or sell. The Christians were seen flocking to the churches, where mass was being celebrated ; men, women, and children hurried to prostrate themselves before the altar, thinking that the prayers of the clergyman could avert the Divine decree. I went with my English friends to visit the churches, which were full to overflowing, all prostrate before their favourite saint, imploring him or her to interfere with the Saviour to assist them. It was a solemn scene ; the sobs and sighs broke upon the ear, and were indeed distressing. From the convents could be heard a low and solemn chant, and then it died away again. There was not a word of courtesy spoken in the streets, except what passed between the English and American people. As yet there was no noise or rumbling, but a frightful stillness in the air ; the birds were silent, and the whole animal world seemed to partake of the terror. The fishing families took to their boats, but I could not see a single line thrown out for fish ; they made the most melancholy spectacle of all. At first there was no motion of the water ; it wore the glassy surface that seemed immoveable. At

length a gentle agitation took place in the water, as if a heavy shower of rain was falling upon it, and shortly after a rumbling was heard, resembling the movements of heavy-laden carriages at a distance on frozen ground. This increased, and the feet as well as the ear were affected with a motion something like that felt by a galvanic battery, or a slight shock from an electric jar. The leaves of the trees had a tremulous motion, like that described of the aspen; the ground began to tremble, and some buildings at a distance were toppling down; but the one in which I stood was only severely shaken, the wall did not crack nor give way. The great mass of the people preferred being in the streets to keeping in their houses; they thought that there would be less danger of being swallowed up in the streets than of being crushed by the falling of walls in their houses. There was no screaming, that I heard; every one was too much terrified to scream. Some few were killed by the falling of houses, even while in the street. The rumbling noise ceased, and the shocks that followed made a noise more like the blowing up of a magazine of powder than of the movements of carriages on frozen ground. Fire, it is said, was seen to burst from the earth in several places. The agony was not entirely gone for nearly two days; all business was suspended, and men, women, and children looked at each other as if it were the last time they were ever to see each other's faces. Sometimes a tear stood in their eyes, but generally they were tearless as the marble statue. The great agitations of life, like its great griefs, are not relieved by tears. The Chinese are predestinarians, and I was informed that they were

quite unmoved, though still and solemn while nature was in such throes and agonies.

The next day, after all was over, cheerfulness took the place of dismay, and one just arrived could not have known that the people had ever felt a moment's anxiety : so are we constituted. I was alarmed, but not dismayed ; and perhaps, as a stranger, I was in some small degree relieved, from not having any connexions in the city, and from watching the movements of others in such perilous moments. I saw some of the places from which it is said the flames issued at certain periods of the alarm. The governor was constantly in the streets, on horseback, and saw that no confusion took place ; and the priests did not take occasion to alarm the sinner, but soothed him by teaching him to trust in his merciful Creator.

After this, when near the Papua Island, we felt a severe shock of an earthquake. At first I thought we had struck a rock and gone on to it, but I was soon informed that we were not on soundings. Several small blows reached us, and the vessel, for several seconds after, shook and trembled, and kept on her way again. I should rather be at sea in an earthquake than on land, although I have no doubt but vessels have been lost by the phenomenon at sea. Fire pervades earth, air, and sea, and the element is destined to show the Almighty's power in all. Why the action of electricity should not be as wonderful and as uncertain in one element as in another I cannot tell. It seems to be an indispensable agent everywhere, and necessary to the existence of every animal or flower, and to every drop of water that flows on the surface of the earth.

From viewing volcanic remains, one would come to the conclusion that a very considerable part of the land of this globe was once under water. It is said that remains of volcanoes are found in France and Germany, and they certainly are in all parts of South America. How wonderful and sublime is the thought, that those vast masses, the Andes, owe their birth to volcanic power, and that they now burn with ceaseless fires in regions that man is not permitted to reach.

In Manilla I made inquiries of the old inhabitants if they remembered La Perouse; and although forty-three years had elapsed since he was in that port, several gentlemen recollected him, and spoke of him as a most interesting man. He was enterprising and observing; and the government of France, under the mild and enlightened Louis XVI., selected him as commander of an exploring expedition. The marine of France was then prosperous, but the nation felt that they had not done sufficient in the way of discoveries to put them upon a footing with other modern powers of Europe. Long before he had completed his voyage according to his orders, he had the misfortune to lose one of his captains and several of his scientific corps: still he was not disheartened, but pursued his voyage, and from the frozen regions of the North-west Coast sent home a copy of his Journal, which reached France in safety. This was the last that was heard from him, that is, the last that could be satisfactorily relied upon; but a thousand vague rumours have been afloat about him. The Journal he sent home was published in a fine style by the government, and shortly afterward it was translated into English, and published in London. This work showed

that he was an acute observer, and that excellent men went with him. During the French revolution his fate became a subject of high excitement, and an expedition of discovery, not only of new islands, but of the fate of La Perouse himself, was fitted out; but nothing was discovered, at least in this particular. The excitement was so great in France at this extraordinary time, and so much was said in the National Assembly and the public prints, that all the world began to feel solicitous to know what was the end of the intrepid and intelligent navigator. In 1825 it was thought that sufficient information was discovered to satisfy any one that he was wrecked on the New-Hebrides, in the Southern Pacific, in south latitude about 11° from the equator, and in eastern longitude about 170° ; but after all, there is no small obscurity about the matter: yet the world were satisfied of two things—first, that La Perouse was dead, and that this was the most probable story that had been told of his shipwreck and loss. With true national enthusiasm, the French spared no pains to learn any thing that could be discovered of their favourite navigator. The probable fate of this brave man has been a subject of the dramatic muse, and has attracted the attention of youths who had never thought of the navigator except from the stage. His wife in this dramatic scene is supposed to have gone in search of her husband; but this, I believe, was sheer fabrication, though it would not be unlike a Frenchwoman to do so, if she had an opportunity to indulge her inclinations.

The English government made war with France while the fate of La Perouse was doubtful; but every cruiser had orders not to interfere

with a discovery-ship, but to render them every assistance in their power. Thus the pursuit of science has so far softened the nature of man, that stern war is ordered to lay aside her fierceness, and aid in advancing the knowledge of mankind. This is a noble feature in modern moral relations, and should never be lost sight of in future wars. Bonaparte was too busy to make many efforts at discovery while he had supreme sway in France, or he was too proud to accept of British generosity in their preservation. Since his time France has not done much for discoveries; still they keep a frigate or two out for that purpose, and the botanical kingdom has been enriched by their labours.

The Russians are desirous of being explorers and discoverers. Kotzebue, the son of the famous German dramatist, has been employed by Alexander, the autocrat of all the Russias, and his successor, as a discoverer; and his voyages are not destitute of interest, though not marked with many discoveries. His object was rather to watch the Russian commerce on the North-western Coast than to give the world any new light upon science or geography.

After all that is due to Portugal, and Spain, and France, and Florence, and Venice, England has done more to give us a knowledge of the size, shape, and peculiarity of this globe than any other nation. For more than two centuries her marine has been the most active and successful. Her great navigator Sir Francis Drake circumnavigated the world, and did it in the ordinary discharge of his duty. He destroyed the armada, and attacked Spain in her new world with energy and success; but with what national right the

history of his sovereign must vindicate. The laws of nations were not then very accurately defined. Dampier next followed, but shared little of the glory of a great discoverer. He was among the rovers who harassed the coasts of Chili and Peru. This was, as we should now judge, piracy; but not so then, for both France and England winked at or protected the freebooters of that day. One great object of his adventuring on the Pacific was to find and capture the yearly galleon of Manilla, which was generally very rich; but in this he did not succeed—she escaped his vigilance. He again visited his native country, and was employed in some affairs of maritime enterprise; and changed his character from pilot to captain, always having some enterprise on foot. His voyages are written with great spirit and accuracy: whatever he said of the South Seas has more graphic spirit in it than that of any other voyager I have ever read. His description of a storm, in an open boat, has no equal in print. He was a man of honest principles, notwithstanding he has been called a pirate by Spanish historians.

Some of the Bueaniers were splendid men, although all their actions could not be justified. Circumstances give a direction to the pursuits of men more than principle. The greatest name, however, among discoverers, is that of Captain Cook. He was first sent out as but little more than a sailing-master, and afterward he was sent to Newfoundland as a lieutenant in the navy. His services were acceptable to his employers, for he showed great tact as a commander, and talent as a surveyor of coasts and harbours. In 1768 he was appointed to the command of the Endeavour,

which carried out that scientific scholar, afterward Sir Joseph Banks, and the Swedish naturalist Solander. One great object of this voyage was to observe the transit of Venus which happened June 3, 1769. They had a fair opportunity to make all the necessary observations at Otaheite. The neighbouring islands were then explored, and much new information gained. The Endeavour then sailed for New-Zealand, where she arrived in the ensuing autumn. He spent some time in these seas, according to his orders, and then returned. Dr. Hawkesworth assisted Cook in his narrative; and such was the popularity of the work, that another expedition was soon fitted out, and the command given to Cook, who was made a post-captain. Dr. John R. Forster and his son were sent out as naturalists; and some of their observations show that they were men of science and discernment. They carried out, also, a painter and an astronomer. This voyage was commenced in July, 1772, and proceeded as far south as 71° ; but was stopped there by icebergs. The navigator returned in 1775; and in July, 1776, he sailed again. In this voyage he discovered the Sandwich Islands, which group he named after Lord Sandwich, then first lord of the British admiralty. On the 14th of February, 1779, he was slain in a fracas with the natives of Owhyee. He was held in high estimation by all the maritime nations; medals in honour of his exploits were struck in England, by order and under the direction of the Royal Society, and his panegyric was pronounced at Florence, in all the sweetness of praise that the Italian language is capable of, and France made his eulogy a prize question. His voyages have

been perused by every navigator who has since visited those seas ; and his name is now as familiar to the natives of the Sandwich Islands as those of their own chiefs.

In this last voyage he was accompanied by an American gentleman, who has since been as much distinguished as Cook himself. John Ledyard attended Cook as a corporal of marines. He had been educated at Dartmouth College, and came two hundred and thirty miles down the Connecticut River in a boat made from a pine-log dug out. He became afterward a student in divinity, a schoolmaster, and then a seaman ; and after a few voyages, having heard that Cook was going out to the Pacific again, he determined to accompany him in some capacity or other, if it was that of a common sailor. He had, while quite a young man, made an excursion among the Indians, and became familiar with their manners and habits, and conceived a strong passion to explore the world, and make himself acquainted with all sorts of people. He was with Cook when he was killed, and his account differs from that given by others, but his is undoubtedly the true one, as he was fearless and had an opportunity to see the rencounter. On his return to Europe he became acquainted with Franklin and Sir Joseph Banks, and became a traveller by profession. He made the attempt to pass through Northern Asia to the American side of the continent. This he would undoubtedly have effected if it had not been for the jealousy of the Russian government, by whose order he was seized at Takutz and brought to St. Petersburg. The Empress Catherine, being convinced that there was no politics at the bottom of his mission,

offered him protection, assistance, and employment; but he had had enough of arbitrary governments, and returned to France and England, and was employed by the African Association to explore the interior of Africa. He proceeded on this expedition as far as Cairo, and there died of one of the fevers prevalent in that climate. He was one of those men born for explorers; curious, patient of labour, above all avarice, and strictly honest in all his exertions, and careful in all his descriptions; he could be relied on as the best authority for all he said or described. His death was deeply deplored in Europe and America; for such men are wanted at all times, and more particularly at that time. Since then a spirit of enterprise is awakened, and hundreds are ready to move as soon as a fair opportunity offers.

The present commercial world is indebted as much to American whaling-ships, as to any other source, for information of the Pacific Ocean. They have been indefatigable in noting accurately all their discoveries, and these have been many. The education of these whalers is excellent in mathematics, and they are indisputable in navigation. From the accounts given of whalers from Nantucket, New-Bedford, Stonington, and other places where this trade is carried on, a considerable part of the whole crew are capable of navigating a ship in any seas. A crew of whalers is a singular anomaly in the maritime government—a head, with prerogatives distinctly understood, and a crew who are sharers in all the profits of the voyage. They are not embarrassed with a multiplicity of orders, but have a plain course of duty set before them, and they proceed to discharge it. From these people the secretary of

the navy has gained much information. The whaling-ships are numerous; probably fifty or sixty of them, from different ports, are in the Western and Southern Pacific Ocean the whole of the year. It is not a particular object with them to explore new islands, but they must necessarily find them in their course; and being capable of forming just opinions upon the appearances before them, the sealers have been careful of divulging their discoveries, if there was a chance of future profit from them; but they have gone farther south than any other navigators, not excepting the explorers themselves.

I often amused the old master mariners by inquiries respecting these matters; but when I determined to take the voyage, I was also determined to learn as much as I could while absent. The good ladies here know that they are on an island in the Southern Pacific, and that is as much as they care to think about the matter; and perhaps there may be some in my good city that do not know as yet that the city stands on the Island of Manhattan, and it would be hard, therefore, to censure others for indifference to any thing but the every day occurrences of life. Perhaps, after all, they are the happiest beings whose sphere is confined and whose knowledge is the most limited.

We were now on our voyage homewards. All hearts were light. The distance was every hour diminishing, and the friends we had left in our native land seemed to fill our recollections with delight. We had been absent more than sixteen months, and this time had been so full of incident that it seemed to me longer than all the rest of my life.

It was found, however, soon after our sailing, that our schooner was too deeply laden, and we sailed for Singapore, to lighten her and put her in proper order for sailing. Notwithstanding my anxiety to get home, I enjoyed this visit to Singapore, for it is one of the most delightful little places I ever saw. It is but a few years since the English began to build up this city, which bears the same name as the island. This island is situated on the north side of Singapore Strait; the location is fine for trade, being in a central situation from the China and Java seas, and all the numerous islands in them, and is not far from the coast of China. It will become the mart of traffic from all the Philippine Isles, which are more numerous than the Arabian tales. More than a thousand and one have been discovered and put down in charts or mentioned in the voyages of navigators. The little city was stocked with pearl, tortoise-shell, ambergris, birds of all sorts, and the whole variety that belongs to the great Eastern archipelago. The island has fine water, and a most luxuriant soil, which the enterprising English are putting into fine cultivation. They now raise coffee, sugar-cane, and indigo; in fact, I can hardly mention any thing of a tropical growth that is not to be found there; and there appears, also, a sufficiency of British capital for all the purposes of commerce. Singapore is one of those places built up at once by the magic of commerce; ten or a dozen years ago, as navigators give it to us from their journals, a few bamboo-huts for the Indian fishermen, or perhaps a miserable Chinese huckster shop, for trading with those who might accidentally touch there, was all that was to be seen. Now a regular well-built

city is found upon the spot, with wide streets, fine sidewalks, uniform and well-built stone houses, painted entirely white. I see nothing to prevent this city from becoming a splendid one. It is so beautifully situated, that it has the advantage of a sea-air; has no stagnant water; and has a fine back country, to the extent of the island. The forest trees are very large and tall; and on the south side, near the city, is a fine plain, of great extent, so highly cultivated, that it seems one great garden spot. The roads around and through this champaign country are excellent, and on each side of them are rows of trees and shrubs in perpetual verdure. The English merchants understand laying out their grounds much to my taste, and a country-seat here reminds an American that those who speak his language and draw their information from the same sources, have been here. This place is well fortified, and has a considerable garrison in a very healthy situation. The whole population of the island is extensive, but the precise number could not be ascertained; there is probably from fifty to sixty thousand, of Malays, Chinese, Siamese, and all that motley group of different nations that collect near a settlement of Europeans. The English population is about three thousand, and rapidly increasing by enterprising merchant-adventurers, and by the healthy situation for the rearing of children; I think the most so of any Eastern city that could be named. The Chinese here, as in other places in this quarter of the world, are the mechanics, and ingenious ones they are, and work very reasonably. The English merchants here give them better encouragement than they find in Manilla, or any Spanish settlement. The materials for

building are abundant and readily procured. The city seems well governed; every one enjoys his liberty as far as would be of any benefit to him, and he wants no more.

The people under a tropical sun take most of their exercise at the dawn of the morning; a ride or a walk is then most delightful. I never could before understand the full meaning of the convening the senate of the skies at this time of the day :

“Aurora now, fair daughter of the dawn,
Sprinkled with rosy light the dewy morn,” &c.

but if the reader had ever been at Singapore, he would have seen the wisdom of the sire of gods in calling his senate together at such a moment. From the earliest dawn the dewdrops are seen trembling on tree, shrub, and flower, and shining all glorious with rosy light. These dewdrops do something more than reflect the rays of light; they distil the sweet essences of all they fall upon, and the sense of smelling is as much regaled as the sight. The odour is not like any thing I ever remember to have enjoyed; it comes not from one aromatic plant, but is the perfume of all “Araby the Blest.” As we rode through some of these delightful groves the smell was so ecstatic that it was near overpowering the senses. We met on our way a great number of gentlemen and ladies on horseback, who seemed to have parted with their native silence and gravity, so often remarked upon by the other nations of Europe; they were as joyous as the morning, and seemed overflowing with happiness. They gave us a most courteous salute, knowing who we were. The English women are truly beautiful.

If they have lost some of their roseate complexion in these tropical suns, which in their native land gives some of them the appearance of almost rude health, they are compensated by fine forms and more interesting looks. They feed more delicately in these climates, eating more vegetables and less solid food than in England. Their being at such a distance from their native land, too, makes them kinder and less aristocratical; they have a sort of fellow-feeling for strangers, for they recollect how lately it was that they came from home themselves. The ladies of Singapoor are excellent horse-women; they have a fine breed of English horses, and they ride with great spirit and fearlessness. When the sun rides high in the heavens, these English people return to their houses, and keep quiet until the shades of evening are extended across the pathway; but the dew begins to fall so soon that the after-part of the day is not so healthy as the morning. How wondrously kind are the laws of nature, that the tree and plant should drink up the poisonous part of the air in the night, and breathe it out a balmy restorative in the morning! On the 23d of January, about the time the winter has set in in good earnest in my native country, and the face of the earth is covered with snow, and every brook, pond, and river is bound in fetters of ice, we were enjoying a perpetual summer. I often reasoned upon this difference of climate, and asked myself in which region, if I had my choice, I could desire to live? Here is nothing of anticipation—all is fruition; but I have my doubts, as we are constituted, if we are so capable of realizing this state as we ought to be. Mortals that are born to be agitated and

tossed about this world require changes of various kinds ; not only those which are brought about by time, but those of seasons. In our dear America we have long evenings of social intercourse in the winter ; lectures for moral instruction ; sermons for religious improvement ; invigorating sleigh-rides ; and mingled with these, all the hopes of seeing the buddings of spring, and the enjoyment of summer again ; and then come the fruits of autumn. The sear and decaying leaf falls to the ground, and nature seems to prepare for repose ; and then winter is again upon us. But in this joyous climate there are no changes, except that of a shifting of the wind, or a shock of an earthquake, which is not unfrequent in all the Eastern regions ; though, as far as I can learn, has never done any injury on this island. If life is not longer, most certainly health is better, and more easily preserved in these climates, than in those of perpetual change. The inhabitants are not liable to those colds which shock the constitution and bring on consumption in our climate. Physicians tell us that one-eighth part of the deaths in our northern climates are from consumption ; I speak more particularly of females : in this climate no such thing is known. In all my intercourse with society in Singapore, I never saw a dyspeptic or a consumptive female. If I have hallowed the enjoyments of my native country, and think the climate of changes is most preferable, I cannot give up the thought of the delights of those tropical regions where simple existence is a bliss ; where nature is for ever at work to rear and to scatter flowers, and never grows tired of her labours. There is a sort of revelry of nature which makes in favour of these

climates against ours ; the birds are more joyous, and the beasts seem to be also ; and surely there is more life in animated nature than in high northern latitudes ; and even the horses of European origin are full of spirit and gayety in these bowers of Eden. The singing of the birds, also, was delightful here. I had been impressed with the belief that the gayer the plumage the more discordant the notes of the feathered tribe ; but this rule will not hold good. The feather has nothing to do with the voice. We get such impressions in America, from the notes of the peacock, the red-bird, and the woodpecker : but birds of emerald hue and sapphire blaze in these regions of the sun have notes as sweet as their plumage is beautiful. I wanted to bring some of these songsters home with me, but was told it could not be done ; that they could not bear the vicissitudes of the voyage. The parouquet is often brought to the United States, but this bird is now no rarity with us, and is not among the most beautiful of his native country. My husband and the officers of the vessel offered to shoot some of all kinds for me, but as I was no ornithologist, and could do nothing with classifying them, or in giving their habits and characters, I could not suffer them to be shot for me.

On the 23d of January, 1831, a party of us left the city to visit the highlands of the island, about six or seven miles west of the town. It was a pleasant jaunt. After leaving the public road we found a pathway of ten or twelve feet wide, cut through a thick forest, and made by great labour. It is as straight as the nature of the ground will admit, and the forest trees are so large and spreading in their branches at the top,

that the road is nearly hid from the sun, and seems, a great portion of the way, as if dug through the hill, excepting that the forest admits—thick as it may be—a little more light than could be expected in a subterranean passage. The ride, although we were obliged to go at a snail's pace, is delightful. Birds of ten thousand hues in their plumage are hopping from branch to branch, almost as tame as if in a cage, they are so seldom disturbed. The horses, acquainted with the way, keep a sure footing; and I think there is but little danger unless to one who is desirous of finding dangers where they do not exist. In two hours we gained the summit, but what was its elevation from the sea I was not able to learn, as I doubt whether it has as yet been accurately ascertained, but it certainly must be more than a thousand feet. The view from this elevation is only bounded by the horizon. The forests are of immense size on the sides of this high ground, gradually lessening as you ascend, but still large near the apex. The southern extremity of the Malay peninsula is in sight, and some of the images are distinct with a good glass, without which a voyager never travels a rod from the shore; and by use, one becomes so accustomed to see through this instrument, that the naked eye view would not content the examiner. With the glass we could bring the cascades of the peninsula clearly in sight, which gave a pleasant diversity to the scene. As you descend on the north-west side of the hill, the eye stretches over some highly cultivated plains, that seem one continuous garden for miles; their flowering trees, at this distance, look like shrubbery in full bloom. No scenery is perfect with-

out a water prospect, and this you have here in great beauty ; you behold the smooth waters of the strait reflecting the islands that are scattered around, and which seem to sleep on the surface. There is a lovely harmony in the prospect ; all, as the painters say, in fine keeping. These waters are not lifeless neither ; the shipping of numerous nations are seen moving along towards the harbour of Singapore, and the little skiff of the Chinese, built with no taste or shapeliness, is seen in every direction. Here is every kind of naval architecture, from the Chinese junk, the Malay prow, and the Sumatra craft, up to the fine East Indiaman, uniting size with beauty, and majesty with a convenient storage. Commerce not only binds nations with a golden chain, but it gives philosophy food for perpetual reflection. The origin of these nations—their history, their habits, their pursuits, their dispositions, are all different ; yet they are all the children of the same great parent, and are all destined to the same immortality. While philosophizing on all around, the mind is invigorated by the pure air, breathed at such an elevation ; and we felt as if belonging to a higher grade of beings than those pent up in the city. These excursions are common in America : we wander from the Catskill to the heights of New-Hampshire and Vermont, as matters of ordinary occurrence ; but seldom does it happen that such excursions can be made in these regions. Time will not allow navigators to take such tours ; or if they could spare a day or two for such objects, it would, in general, be unsafe to try it. The natives are so fond of plunder, and so treacherous as not to be trusted. In this island, however, all is safe ; where Eng-

lishmen and Americans are, there is no danger of evils from savage men. It is my belief that these two nations are to govern the world, so far as to have their policy and laws adopted in regard to commerce, and liberty extended to all nations, particularly in regard to the abolition of slavery.

On the 24th of January we were ready for sea, and a number of our friends came on board, and took a sail with us for several miles—just far enough to make it pleasant; and then took leave of us with great affection. People so situated are given to hospitality, much more so than those in crowded cities in old and populous countries; they consider every stranger as a visiter, and exert themselves for his happiness. He is to them a sort of link between them and their native land; his presence brings up ten thousand associations that are delightful. We read the same books—are familiar with the same incidents—concur in the same remarks—and have no party interests to distract or confuse us. The first person a female forms an acquaintance with in regions remote from home, is the priest of her own religion, if she happens to find one, or with the physician, if she should happen to need one. Dr. Almadi, of Singapore, was attentive and kind to us, and has laid us under many obligations of friendship. His two sons are gentlemanly young men, promising merchants in the city. This evening we came to anchor in the Straits of Rio, within a short distance of the shore, and the next morning sailed again through the straits, which we passed early in the evening. This precaution is necessary from the numerous coral reefs scattered along the coast. A navigator

cannot be too cautious; hundreds are lost from a want of carefulness. On the 26th, we found ourselves in the Java sea, and thence steered for the Straits of Sunda, and arrived at the eastern entrance thereof on the 28th. We sent a boat ashore; but before she reached there, we perceived with our glasses that the natives were in motion, and so suspiciously so, that a signal was given from the schooner for her to return, which she did without landing. Formerly the natives were not hostile; but it is said that they have latterly got a taste of blood, and have become savage and treacherous. A great deal of information of these seas may be found in Horsburgh's Directory; a work which my husband praised so highly that I studied it as a country justice does the Farmer's Almanac, not only for dates, but for matters of opinion. This cool and intrepid navigator spent a good proportion of his life in the East India seas, for the East India Company, and was a great matter-of-fact man, to which were united sound judgment and wonderful perseverance. Such a man is truly a benefactor to mankind; he shows us how to shun evil, and how to take the best advantage of our situation. This East India Company, whatever politicians may say about monopoly and exclusive privileges, has done more to make safe the navigation of those seas, than all the world besides. Governments are not generally disposed to do much for a general interest; our own has hardly made a chart for the navigator. I was mortified that in every country we visited, we had to sail by charts of other nations; we even left our own "sublime port," the harbour of New-York, by an English chart. I am not wise enough to understand this,

when next to the English we are the greatest wanderers over the globe, and have as much at stake as any other nation but the English everywhere, from the north to the south pole. Nor had we any books on board written by our countrymen, giving us particulars of those seas which we visited. I have understood, however, that one or two volumes have lately been written upon this subject by our countrymen, which give some account of a part of our course, but I have not seen them; we had nothing of the kind with us when we sailed. Our books were generally English, and to these alone we had recourse. Much may be written, however, without interfering with what has been done.

These seas are dangerous. At our tops were stationed men with arms to prevent being boarded. The Malays are proverbially treacherous, but when met with spirit are not persevering in their hostilities. They are proud, revengeful, and avaricious. Their climate makes them indolent, and of course they know but little of the blessings of industry. They have something of the taste of the Chinese in their manufactures, but are too lazy to improve. Their dress is singular to us, but all the Asiatics resemble each other in dress, that is, all the civilized nations. They are Mohammedans in their religion, and wear turbans on their heads, differing but little from those of the Turks; but they are more tenacious of all religious observances than even the Turks. They deal in mysteries and study magic, pretending to great proficiency in the art. Although the Christian religion has not entirely freed the world from this superstition, yet it has done much towards driving it from Christendom. Their professed

magicians now, for aught I know, are held in as high veneration by the common classes of people as those of the olden time were at the courts of Babylon. It is a great mistake with us to suppose that these Malays are ignorant of letters ; I have seen some fine pieces of chirography from them. Most of them carry charms and amulets about them, as preservatives against sorceries. Like all the Eastern nations, they make ablutions a part of their religious ceremonies. It is said that the Koran prescribes all these ceremonies, and it does,—but Mahomet found such customs prevalent among the people, and, with great sagacity, made them a part of his religious creed. The laws among the Malays are such as generally prevail with the eastern nations, only they come in a more barbarous form than those found in some others. They are revengeful, and often take the law into their own hands when insulted.

We were once more in the Indian Ocean, on our way towards the shores of America. The trade-winds are a great curiosity to one who pretends not to read nature deeply ; you find them blowing steadily for six months one way, and then change and blow six months the other : but wo betide those who are caught in those seas at the time they are shifting. At that season, the winds are variable, and storms of rain and thunder gather up and make the navigation difficult and dangerous. In crossing these seas, the voyager, like myself, who had nothing to do but read for amusement, can find various theories respecting the causes of all these remarkable things ; yet, perhaps, it is the best-way often to time one's voyage in such a manner as not to be in danger of meeting these perilous seasons. We experienced

near Java Head variable winds and heavy thunder and lightning, until we took the south-east trades, which was about the 12th of February, 1831. We continued our passage to the south and west until we passed in sight of the Isle of France and the island of Madagascar.

As we came near the Isle of France, I most earnestly wished my husband to touch at it, for here I understood reposed the remains of Mrs. Harriet Newell, a missionary from New-England. Her life was an interesting one, and the latter part of it full of incident. She was a daughter of Mr. Moses Atwood, a merchant of Haverhill, a beautiful town on the banks of the Merrimack. Her family was highly respectable, and she received a good education. About the year 1806 or 1807, she became religious, and was active in her piety. Her correspondents were numerous, and she wrote like one deeply imbued with divine grace. In the midst of her zeal she was a pattern of modesty and moderation; she was kind to all about her, and while taking a lead in matters of religion, she was strictly attentive to every domestic duty. Her name became familiar in all the churches, and when the board of missions for India in the United States had selected several promising young gentlemen, for the purpose of sending them into the East to spread the glad tidings of the gospel, Mr. Newell was one of them, and Divine Providence brought him acquainted with Miss Atwood.

Missionary labours and fatigues and dangers were the constant subject of conversation, of preaching, and prayer. She was from the first attentive, and at length her mind was wholly engaged in the great cause. She set about with

her friends preparing some articles which it was thought might be wanted, for those about to take upon themselves the arduous and perilous undertaking. She often spoke to Mr. Newell with so much fervour and affection for the cause, that he ventured to ask her hand, and to request her to share in the great work of saving souls with him. She had not contemplated the subject before, but after taking the advice of her religious friends, and of her family, and seeking direction from Heaven,—although there were many doubts and some opposition,—she made up her mind, and engaged in the cause with her whole soul. It was enough to shake the firmest mind, to think of leaving home—sweet home,—of parting with mother, sisters, and brothers, and a train of dear friends, made dearer by religious bonds of affection; but she surmounted all, put her trust in the Lord, and took her departure for the Indies, as an humble missionary in the cause for which her Saviour died.

“I never shall forget,” says one of her male friends, “the hour of Mrs. Newell’s departure. The circle were engaged in prayer, and a clergyman with a harsh voice and strong lungs was leading in the devotions; he struck with no gentle hand the chords of the heart, and the little group could not refrain from tears and sighs: all were convulsed at the thought that they might never see her face again. When the clergyman had ended, she cast her eyes around, and fearful of the effect of this impression, in a voice sweet as an angel’s, she began to speak to her distressed friends. She represented to them that her beloved Saviour was everywhere a protector of those who obeyed his precepts; that he could soften

the rage of intolerable suns, and break the iron heart of obdurate man ; that he could make the dying bed as soft as the downy pillow ; and that as life was short, and the time for doing good limited, it was for each one to go his way and commence his labours. She spoke of the union of souls by the influence of prayer ; she said that there was no such thing as distance between the good and their Father in heaven ; that humble means in the history of man had brought about great ends ; and that even she, an humble sinner, might be the means of saving a soul, which would be sufficient reward for all she might suffer. She commended all to God, the staff and stay of the widow, the father of the orphan, and the consolation of all who sought him. Never had mortal words a kinder effect. 'The sobs ceased, the trembling voices of her friends assumed a firmer tone, and their farewells had no convulsions in them. As she turned to depart, her eye caught that of the narrator of this scene ; they had once been intimate friends, but he, as a man of the world, had smiled at what he called the enthusiasm of the revival, and had seldom seen her after she left the gay circle of her youth ; she stepped forward without any embarrassment, stretched out her hand, which was grasped with no little emotion, and with an affectionate smile said, ' My dear L., the time will come when you will think better of all this ; my prayers shall be for your conversion. Have no fears for me ; I go on my Saviour's errand ; may we meet in heaven.' She gave them a benediction, and he could not but see and feel, that

' While on their knees they lingered yet,
There fell a light more lovely far
Than ever came from sun or star.' "

Mrs. Newell went to India, and suffered much from the fatigues of missionary travels, finding more difficulties in the way than was anticipated. Her constitution was never strong, and fell under her sufferings ; she expired at the Isle of France, on the 30th day of November, in the 19th year of her age. She lived long enough to show the sincerity of her religious zeal, and her willingness to die in such a cause. She wrote some letters to her friends, breathing the airs of holiness, which have reached the hearts of many who were fainting and despairing on the way to Zion, and given them strength to bear the heat and burden of the day. If she could have found a resting-place, she would have laboured assiduously in the great work she went out to perform ; but as it was, she only showed the spirit that was within her. I understood that an American ship-master, a man of piety, found her grave without stone or name in this island, and reared the best one he could for the time. In some future day, the traveller from the land of her fathers will build the proud mausoleum over her remains.

I had heard before my departure from the United States, that her friend and fellow-labourer, who had long been in the vineyard of the Lord, Mrs. Judson, had departed this life also. She was a woman of still finer talents than Mrs. Newell, and lived to do much good. She was, as fame relates the story, an ambassadress of the King of Ava to the British, when war and desolation were carried into his territories ; and by her means the effusion of human blood was stopped. The world may, and do, censure the practice of sending out females with the missionaries ; but I am convinced that men will do but little good without their

wives and families. 'The ignorant natives feel the influence of example more than of precept, and when they see whole families living in peace and domestic affection, they strive to imitate them; they go to the hut where the missionary and his family reside, and seeing the neatness and all the little conveniences which exist there, they feel a desire for the same things arising in their own minds; and will labour, although indolent by habit, to acquire such comforts as can easily be attained in these fruitful countries of the East. The women first show a love of dress, then of cleanliness of person, and every step in the progress of imitation is so much gained in the march of civilization.

It was delightful to see at New-Zealand how much this imitative spirit had effected, even in the manner of taking their food and receiving their guests. 'The queen was quite a lady, while the king, as I have before mentioned, was making himself an English orator. There is another reason why men should take their families with them on a mission; they are more contented, and are more steadily engaged in the great work than they would be alone. 'The native females are taught sewing and household affairs, and impressed with the necessity of going on with the great work of mental improvement and religious advancement. In the diffusion of even our holy religion, in the days of our Saviour's appearance, the women were among the first and most faithful of his disciples; they listened to his doctrines, sought him through life, and followed him to the tomb. 'Those who take up the cross must expect deprivations and long-suffering; they must leave father and mother, and all the world, for the good of their fellow-men. If ever there was sincerity

anywhere, it is in an honest missionary's heart. They will be treated as fools and madmen by some; and, cut off from all the charms of cultivated society, they will go down to the grave generally unhonoured and unknown, but their reward will be an incorruptible crown.

In this sea the phenomenon of the luminous appearance of the surface of the water was more remarkable than I had ever witnessed it at any other place. At night the sea appears one blaze of light. I have watched this extraordinary appearance many evenings as a subject of curiosity and pleasure, and was anxious to know what light philosophy had thrown on the matter. I looked at all the books we had, in hopes of finding the causes of it, but after a while formed my own opinion upon the subject, although I do not pretend to give it as one of certainty where others have been in doubt. Father Bourzes, a Jesuit, in 1704, marked this phenomenon in his voyage to India. This class of men, who have been a subject of censure for so many years, have been the precursors of most of our knowledge of the appearances of nature, as well as of the moral condition of man. Among their faults was not that of apathy or ignorance. The finest descriptions the world now has of all the wonders of nature came from these holy missionaries; the description of sea-objects, the soil, climate, cataracts, and prairies, came from them; they encompassed sea and land to make proselytes, and kept eyes and ears open in every step of their progress. Of their religion I have nothing to say; it is not my religion. The pious father notes the singular appearance of the sea, but does not venture to give any reason for its causes. He was

going to a new world to guide the heathen in the paths of religion; but he was also, according to the instructions of his order, obliged to notice every thing remarkable in his tour. This phenomenon was discussed by the philosophers of Europe with considerable acumen; but nothing satisfactory was given until of late years. The first solution was that of electricity, and for a while this was satisfactory to most navigators; but on the voyages of Captain Cook, in 1772, '3, '4, and '5, Mr. Forster started a new theory, which had so much plausibility in it, that it was not questioned for many years. This was, that the singular appearance was caused by animalculæ, which, analogous to the firefly, had the power, at pleasure, of emitting light, and did so whenever the surface of the ocean was slightly agitated. This many experiments seemed to prove, and the doctrine became general, for there were many facts going to show that his opinion was correct; and it is now conceived that there are many sea-worms or insects that emit light in the ocean. But the best opinion now extant is that of Mr. Couton's, that this appearance arises from putrefactions in the sea. The phosphoric appearance of a fish in a short time after he was caught led him to make many experiments, which go far to show that his solution was just. He put fish into a quantity of salt water, and marked the effects of their putrescence on the appearance of the water; and ascertained that in proportion to the decay of the fish was the luminous appearance of the water. These particles of decayed fish, being lighter than the water, rise to the surface, and on a gentle agitation emit the phosphoric light which makes so wonderful an illumination. This appearance

is more observable near land than at a great distance from it ; and it is well known that the great mass of the inhabitants of the deep are near the continents and islands. Perhaps in no situation of all the vast expanse of the ocean is this phenomenon more distinct than around the islands of the Southern Pacific. The wonders of the land man has been examining from the birth of creation ; but of the treasures and population of the ocean he has, as it were, just commenced his observations. The innumerable productions of the ocean are astounding ; not only may it be said

“ Full many a gem of purest ray serene
The dark, unfathomed caves of ocean bear,”

but not a tithe of its population is as yet known. The earth, using this term for the land only, with all its nations of men, its beasts and birds, its creeping things—countless millions in all,—has a sparse population compared with the sea. If the death of these, by violence and natural decay, do not “incarnadine the sea,” it is very natural that the remains of these innumerable hosts—for death happeneth to all things belonging to our globe—probably rise to the surface, and float on in rays of light ; and why not another emblem that the ashes of our frames sown in corruption will rise to light and glory in another form ? It surpasses the wonderful,—it is indeed miraculous, that so many things should exist in the waters under the earth. Who can look at the leviathan of the ocean, spouting and blowing, and playing in the mighty deep, a terror to man when he first saw him in the tremendous majesty of his bulk and strength, now subservient to man, as a thing of

no power compared with human sagacity, and the very essence of the monster reduced to the purpose of illuming his halls, or of chasing away the shades of night from the nursery of his babes, and doubt that man had power given him over all that live upon the land or in the sea? The luxurious Romans knew nothing of the brilliancy of a sperm candle.

The fisheries, in all parts of the world, furnish no small part of the food of man, and yet there is no diminution of the stock. The great fish, if Dr. Mitchill will allow me to call a whale a fish, are no doubt diminished; but it is not in the power of man to destroy the race of them, which according to the best accounts of ichthyologists, produce as ten thousand, and even to a million for one taken yearly. Millions of the cod are caught on the northern shores of America yearly, yet no diminution has ever been perceptible.

The analogy between things in the water and on the land has often been a subject of inquiry and discussion, and perhaps there is in it something of reality. There are sea-dogs, sea-elephants, and sea-horses; but in many respects the resemblance is fanciful: but to man, the constituted lord of all, I do not believe that the sea furnishes the slightest resemblance. We women have been complimented by sister mermaids; but I believe all this race have been females, even in fable. The wonders of the great deep, I believe, will never be fully discovered; but there is no necessity for indulging in creations of fancy when there is enough of fact to satisfy any one.

When I playfully adverted to the opinions of Dr. Mitchill respecting the whale, I intended no disrespect to the memory of that learned man.

He was indeed a learned man, familiar and kind as learned. He had the happiest faculty of making himself understood, and his descriptions, in his lectures and publications, are all simple, accurate, and beautiful. He was a great lover of nature, and studied her laws profoundly. He discussed every thing, from the huge whale and ponderous mastodon, to the microscopic shell and the animated dust of a fig-leaf. He seemed inspired by every muse in the department of each. His own collection of natural curiosities was a rare one; at once an evidence of his knowledge, his industry, and his taste. He made himself master of so many facts that he was a living chronicle of the history of nature, as well as of the deeds of men. He was acquainted with the nomenclature of every science, and had every term ready at his tongue's end; but he never darkened his subject by a display of them, for he explained the etymology of the term he used, and the necessity there was of the word to convey an accurate meaning. The great doctor believed much, because he knew much; and with all his knowledge, he was as communicative as those who were bursting with their first rays of intelligence. The doctor was extensively known at home and abroad; he held a correspondence with some of the most learned men of the age, and every one thought him truly a great man. Future times will hold him higher than the present does; when his favourite pursuits become more fashionable than they now are. I understand that great exertions are making by intelligent members of this community in the city of New-York, and other parts of the country, to increase the number and respectability of Lyceums.

On the 4th of March we spoke an East Indian, from Canton, on her voyage to London. Captain Gates, the commander, most kindly offered us any assistance we might stand in need of, but our provisions were abundant, and we could only acknowledge our obligations for his kind offers. There is a courtesy growing out of circumstances which becomes a habit, and from that passes to a principle. Those who have been in want know how to lend their assistance to others, and every mariner, with all the foresight and prudence in the world, must, at times, be in want of the necessaries of life. The offers of Capt. Gates were so kind, that I was almost sorry to find that owing to our superior sailing he was nearly out of sight in a few hours. How much happier would our lives pass on shore, if we were employed in offering kindnesses to one another, and in watching to see what good we could do our fellow-travellers through the world. Selfishness seems to belong to great cities. It is not found where the inhabitants are few ; or at least it is not so perceptible.

CHAPTER VI.

Saldanha Bay—Refitted—Visit to the Cape—Description of Saldanha Bay—Table Mountain—Comparison between the Animals found at the Cape and the Race of Men—Description of the Condor—His Habits and Character—The Albatross—His Habits and Character—Superstitions in Regard to the Condor—Hottentots and Lions—Character of the Lion—The Elephant—Ostriches; Description of, and their Character—Accuracy of the Scripture Account—Garrison at the Cape—Camoens and his *Lusiad*—The Character of this commercial Epic—Fate of the Author—Reflections upon the Restrictions upon Trade.

ON Thursday, the 10th of March, we came in sight of the Cape of Good Hope, but it was some miles distant, whence we steered for Saldanha Bay, and came to anchor there on the 12th. All hands were as busy as the inhabitants of the city of New-York are on the first day of May. They were taking down sails, splicing ropes, mending, patching, darning, and cleaning; for a few days, all were as much engaged as carmen, chambermaids, and housewives at the stirring time I have mentioned. It is not wonderful that our schooner should be out of repair in her sails and rigging, when it is recollected that she had been from home more than sixteen months.

On the 14th I accompanied my husband on shore, and we received a most cordial welcome. He had been here before and made several acquaintances, who were now emulous to show every kindness to his wife.

The Bay of Saldanha is the place where the

fleet anchored to protect the English troops under Sir David Barard, to land for the last conquest of the Cape. This was a fine place to anchor, and the garrison of the Cape was at too great a distance to give them any trouble while landing. We visited the village, and found the people quite contented under the British government. Sir David had seven thousand troops under his command; and although he was met with great courage by the Dutch commander and the forces under him, yet the action was soon decided, and the British have had the possession of the Cape ever since. It is a fine stopping-place for ships on their way to India, and sufficient of all necessaries can be furnished at short notice. The English thought this place of much consequence to them; and although they had taken the place once before and given it up by treaty, at this second conquest they thought it better to retain it.

The Cape of Good Hope is situated in latitude $33^{\circ} 55'$ south, and longitude $18^{\circ} 24'$ east. It was discovered by the Portuguese in 1493, and was called by the discoverer, Bartholomew Diaz, Cabo dos Tormendos--the Stormy Cape,--for he experienced much bad weather there; but his more sagacious monarch, John II. King of Portugal, named it the Cape of Good Hope, as he entertained the hope of finding the way to India by doubling this cape, which was soon after done by Vasco de Gama. The Portuguese never formed any settlement at the Cape; they had but few people to spare for colonizing any but the fairest portions of their discoveries. The Dutch, about 1650, took possession of it, and drove away the Hottentots. They wanted it for a watering-place, and found no difficulty in re-

ducing the ignorant and miserable race of savages who were natives of the country to slavery. These Hottentots are small in size, but are much esteemed as slaves, for they are the most abject of all the slaves in the world. The Malays and other slaves, when goaded by ill-treatment, have some flashes of resentment about them; but these abject wretches have none. The south and west of the Cape are washed by the ocean, and on the north a long range of mountains is seen, some of which reach the point of perpetual congelation. The population of the whole country now owned by the English is very sparse, not giving one inhabitant to a square mile. It contains a great variety of soil, but the drought is excessive at certain seasons, and there is no vegetation for many months in the year. When we were there, we saw large tracts of country blooming with a great variety of flowers, and affording abundance of herbage, which shortly before this was as dry and sterile as a clay heap.

The Table Mountain is one vast mass of rock, rising in naked majesty three thousand five hundred and ninety-six feet in height! Its very look is frightful. Some persons, it is said, have reached its summit, but it seemed to me to be accessible to none but the great birds of heaven. The condor and the eagle are seen in the gray of the morning poising around its summit, as if in scorn of the powers of man. It is thought that they frequently rise with their prey to the sides and top of this mountain, to devour it in peace. After gazing a few minutes through a good glass the mass seems too heavy for the earth, and you feel as though it must sink, and carry with it all around you. The rock is of primitive formation;

it has been there ever since the birth of creation, and probably will stand there until

“ Wrapt in fire the realms of ether,
And heaven's last onset shakes the world below !”

This rock was not smote by the hand of the prophet, for no water gushes from it except what drizzles down from snows or dews. If this sublime mass had been near tasteful Greece or poetic Italy, how much it would have assisted the writers of the works of imagination ! There, not a mountain rears its head unsung, nor a brook that babbles along, but has been celebrated in all the charms of verse. Camoens alone has made this region a subject for the muse.

It is worthy of remark, that while the beasts and birds of this region are wonderful in size and strength, the race of men should be so inferior in their proportions. Until our times, the eagle was considered by ornithologists as the bird of Jove, holding supreme sway over all the feathered race. He was described as soaring higher, and keeping longer on the wing, than all others of the air. For majesty, strength, and vision, he had no compeer, but modern discoveries have robbed him of all his superiority in these regions, as well as among the Andes. The condor is now enthroned in his place. Until this age, the condor was ranked among the creatures of fable, with the roc, of Arabian imagination and description, or with the wonders of Gulliver, in his travels. Swift undoubtedly made his stories of gigantic and diminutive nature as a satire upon the tales of travellers, but in our time his sarcasm has lost something of its effect from deeper investigation

and more patient researches. The condor of Africa is at the head of the vulture tribe. His size is twice that of the American eagle; some of them indeed have been killed, whose extended wings measured twelve or fourteen feet. He is almost constantly on the wing, and soars at a sightless distance above the earth. This upper region is truly his abode—the scene of all his joys; and he comes down to the ground only to secure his food. He has the scent of the common vulture, and the eye of the eagle, enlarged even in greater proportion than his body compared with that of the eagle. His claws and beak are in proportion to the spread of his wing. He is coarse and vulgar in his food; and, notwithstanding all that has been said by the poets of ancient and modern times, so is the eagle. The Hebrew description of the productions of nature, after all, is generally the most accurate. The Bible says that where the carcass is, there are the eagles gathered together. The condor, driven by hunger, scents or sees from his sublime height what is lying or moving on the earth, and comes to seize it with almost incredible velocity. He feeds on dead carcasses when they can be found, but otherwise it attacks the flocks and the herds. He has been known to associate with others to attack full-grown bullocks, and to destroy them; but from his very nature he is generally a solitary bird. The Table Mountain is hardly sufficiently elevated for him to relish his prey, which he often ascends with; he requires a keen air. The condor has been caught at the Cape, and in South America, and brought to the United States, where he has been examined thoroughly. He is in every respect a wonder, and amazing stories are said to be current among the Hottentots of the prodigious

size and strength of this bird, such as their having been seen with an elephant in their claws. These stories go to show that even the most stupid of human beings have some imagination: Asia does not originate all the wondrous things in story. The condor flies like the eagle, except that he is slower in his first movements, from the great extent of his wings. His feathers are closer and smoother than the eagle's, and he can rest in the loftiest regions of the air for a long time without any apparent motion, but probably, like the eagle, he has the power of moving the lesser feathers while the wings seem perfectly still.

Turning from a look at the mountains, and extending your gaze over the ocean, a sea-bird of equal size and larger wing may every day be seen. The albatross is remarkable in his habits as well as in size. He is a web-footed bird, resembling in some degree the domestic goose as to the shape of its head and body; but the bill is more hooked than that of the goose. The great length of wing gives the albatross superior swiftness in flight to all other sea-birds; and, large as he is, he skims with the fleetness of a swallow over the water, catching every thing that comes in his way. He is a great feeder, and sometimes acts the glutton to such an extent as to be easily taken while resting on the smooth surface of the sea. It is amusing to watch his flight after the flying-fish, he poises, scales, and turns so adroitly. The albatross appears to have no regular home, but courses over half a world for his food at different seasons of the year; he is not only found at the Cape of Good Hope and on the North-west Coast, but also at times in the Austral seas. He flies so easily that he clears him-

self of a storm by rising above it, and keeping himself there until the whirlwind has passed away. The albatross is tame, but not courageous, for he is often beaten to death by smaller birds, and makes but a feeble resistance. The extent of their wings, when spread, is ten or twelve feet in general, but they grow to a much larger size. They are never taken for food, even by the Indians; they are too coarse and oily for food for any thing. The albatross is seldom killed by American or European sailors; they have some superstition that it betides ill-luck to kill them. Perhaps this may arise from the fact that this bird has often visited vessels farther from land than any others, and, as the sailors say, has taken more pains to board them than all the rest of the feathered tribe. Some of the largest of these birds have been killed and brought to this country, but in general their lives are spared, for it requires a very brave man to oppose a superstition entertained among mariners, as all the misfortunes of the voyage are always charged upon any violence done to a settled prejudice. Ignorant men will more readily do violence to a positive command of their Maker than to a fixed error of the imagination. Coleridge, the poet, has made much use of this superstition in his poem called the

RIME OF THE ANCIENT MARINER.

“The ice was here, the ice was there,
The ice was all around:
It cracked and growled, and roared and howled,
Like noises in a swound!

At length did cross an albatross;
Through the fog it came;
As if it had been a Christian soul,
We hailed it in God's name,

It ate the food it ne'er had eat,
 And round and round it flew ;
 The ice did split with a thunder-fit,
 The helmsman steered us through !

And a good south wind sprang up behind ;
 The albatross did follow,
 And every day, for food or play,
 Came to the mariner's hallo !

In mist or cloud, on mast or shroud,
 It perched for vespers nine ;
 Whilst all the night, through fog smock white,
 Glimmered the white moonshine.

God save thee, ancient mariner,
 From the fiends that plague thee thus !
 Why look'st thou so ? With my crossbow
 I shot the albatross !

The sun now rose upon the sight ;
 Out of the sea came he,
 Still hid in mists, and on the left
 Went down into the sea.

And the good south wind still blew behind,
 But no sweet bird did follow,
 Nor any day, for food or play,
 Came to the mariner's hallo !

And I have done one hellish thing,
 And it would work 'em wo ;
 For all averred I had killed the bird
 That made the breeze to blow ;
 'Ah, wretch !' said they, ' the bird to slay
 That made the breeze to blow !' "

The earth here, as well as the air, teems with wonders. The lion of the Cape is the largest and fiercest in the world, and although he has been driven from many places where he once roamed, he still holds his ground in Southern Africa. His roar is often heard in the abodes of Europeans ; but he does not often make his appearance near the habitations of men. The Hottentots have no fears of the lion, nor of any wild animal ;

they contend that all that are ferocious in the forests or deserts are afraid of man, and this is probably the case. A lion never attacks a man unless he is famished for food; and then his hunger is generally superior to his courage. They prey on the harmless antelopes, and never venture to attack the elephant. Many an officer in these regions has, with the help of natives and dogs, gained laurels for bravery in lion hunting who did not risk much in the contest.

The lion, like all other creatures of greatness, has been extolled and abused ever since he has been known. The Arabians, it is said, have about fifty names for this monarch of the plains. His strength is not at all overrated by any, but his magnanimity has often been questioned. Notwithstanding all the stories of ancient times, of Androcles and the lion, and of the many other legends of those ages, modern writers on natural history have made the lion a cowardly, sneaking, miserable cat, with only more strength than his enemies, and without half the courage of a terrier dog. The truth is between these historians. His magnanimity may sometimes be mistaken for cowardice, and his prudence for fear. That the lion has strong affections no one who knows his history can for a moment doubt; and we have all seen enough of him in a state of slavery to know that he has some generous traits in his character. It is from a well-authenticated account of a lion and a friendly dog that I extract the following. — In a caravan which was exhibited a few years since in the United States, a large lion was the head of the show, and a monstrous sized dog was his master's faithful friend. On some occasion the whole caravan grew restiff,

and the keeper, somewhat alarmed, requested the audience to retire, inviting them to return on the morrow. The lion growled, and snapped his teeth at his keeper; the dog saw it, and in a fit of indignation bit the lip of the lion. This brought the latter animal to his senses, and he crouched and groaned and moaned, and refused that night and the next day to taste a morsel of food, but kept up a look of contrition towards the dog. The owner was apprehensive of losing his property, and entreated the dog to make up with the lion. At length he succeeded in getting the dog to approach the lion's cage and lick his wound. The lion's joy was excessive; he growled his affection, and seemed quite frantic in his demonstrations of happiness.

The ponderous elephant never goes out of his way to attack a man; he also is afraid of him. Whole droves of elephants will pass within a few rods of a hunter without giving him the least fear. The almost naked African traverses the deserts or the forests as fearlessly as if he had dominion given him over the fowls of the air and the beasts of the field as distinctly as it was given to Adam in the days of primeval innocence. From the enormous tusks which are brought to this market from the country, the size of the giant of the forest may in some measure be calculated. Some of these tusks weigh over a hundred pounds.

These are not all the wonders of the woods and the sands. Ostriches are plentiful here; many are brought every year for sale to the Cape by the natives. A full-grown ostrich is from eight to eleven feet in height, and the most awkward looking bird that ever was seen; but

some portion of its feathers are delicate and beautiful. They were used as an ornament for a female headdress probably long before the records of man began, as they were when Vasco de Gama discovered the Cape, and would now be if the natives were not slaves; or if those who were not bondmen and bondwomen had not found that these plumes could be exchanged for something which they preferred to ostrich feathers. The ostrich is often hunted, but such is the fruitfulness and the abundance of food for the bird, that they are still found in great numbers; and their eggs are served up at every great feast given among the officers of the garrison as a delicacy.

Modern writers have stated that the ostrich incubates her eggs, and has as great a regard for them as any other bird; now this assertion appears to me unfounded. The ostrich cannot set upon her eggs; there is no joint in her legs that will allow her to bring her body upon her nest. Job is worth a hundred philosophers upon the subject: "*Gavest thou the goodly wings unto the peacock, or wings and feathers unto the ostrich?*" "*which leaveth her eggs in the earth, and warmeth them in the dust; and forgetteth that the foot may crush them, or that the wild beast may break them. She is hardened against her young ones, as though they were not hers.*"

An observing philosopher, who had spent the better part of his life in Asia, an officer, once gave this solution of the subject: The ostrich starts from the forest to the desert to deposite her eggs. She lays two eggs, which are deeply covered with the sand; then seven or eight more, which are but partially covered. The first produce

young ones, who, as soon as they have broken the shell, begin to feed upon the roasted eggs which have been deposited there for food, until they get strong enough to set out on their journey to the wilderness. This is full of wisdom, and resembles all the accounts which have been given of the ostrich.

It is now a matter of fact to all the hunters of the ostrich, that at "*what time she lifteth up herself on high she scorneth the horse and his rider.*" In catching her now, one fresh horse succeeds another until the ostrich is tired down. It is a most extraordinary fact, that the stomach of this bird, made, as it is said, to consume fruits alone, should have such powers of digestion as to consume lead, iron, or almost any other metal. Those brought to the United States are generally destroyed by trying this experiment too often. This tall bird is good-natured, and the ancients thought marked with folly; but modern times have learned to discriminate awkwardness from folly, and adroitness from wisdom. It is said that when the ostrich hides his head among the weeds, he thinks he is not seen; does not even wise man do pretty much the same?

The garrison here is large, and is composed, generally, of well educated men. The society is much better than it was under the Dutch government. The staid and solemn character of the Dutch may make a place a good permanent residence, but they do not give society any of the musical spirit which makes it delightful on a short visit. They catch not the graces of the passing hour; I speak of those who have lately come from their native land. The descendants of the Dutch in my native state are not only

among the most solid portion of the community, but also make up a highly respectable part of fashionable as well as of valuable society.

The Cape of Good Hope promises, under present auspices, to be an opening for civilization to enter Africa ; and not half of the wonders and the treasures of this country are as yet known.

The region over which we have lately traversed, and where we now were, was one of epic grandeur, although still so much unknown. Camoens, who was born soon after Gama doubled the stormy Cape, and who wrote before Shakspeare or Milton, made the voyage of Vasco de Gama the subject of an heroic poem. Among the first recollections of this poet were the tales of the adventures of this great navigator. Delighted with his romantic theme, Camoens, who had tried his hand in madrigals and sonnets, in early life, contemplated an epic, which he called the *Lusiad* ; and to bring it to perfection he visited those seas and countries which had been discovered by Gama. His life was one of trials and misfortunes ; he lived with kings and expired with beggars. He held honourable employment under some of the viceroys, and at one time accumulated no small portion of wealth, which was afterward lost in a shipwreck. He was too open, bold, and satirical to live in a court of parasites and flatterers, and he despised the whole of them, from the highest to the lowest. He died with the patriotic expression "*Oh my country !*" on his lips, and with more reason than most men who have used this lamentation. Portugal was then the first of all the maritime powers, but Spain and other countries were in the days of Camoens contending with, and indeed rivalling Portugal. The epic

of Camoens is divided into ten books, and, for the age, was full of poetry. To his credit, too, after all the fiction he has introduced, sometimes reveling in heathen mythology, mingled with scriptural allusions, it abounds in truths. He carries his hero around the Cape, and brings him in competition with all the Moorish princes, who had held the best portions of the traffic of the Indies for ages. His struggles with these warlike merchants are finely described, and all the new sensations which this mighty struggle produced. Everywhere, after his time, the navigators of these regions inscribed on the bark of trees wherever they landed this proud inscription, "TALENT DE BIEN FAIRE." The reader of the *Lusiad* of Camoens will find in it at all times many beautiful passages; but when reading it on the very spots he describes, it seems to bring author and reader together, although nearly three centuries have elapsed since the poet visited them. Camoens was surely an observer of nature, as well as an accurate historian. He describes the high-born cavalier preparing for his departure to unknown regions with graphic accuracy and in an elegant style. De Gama leads all his sailors to a chapel the night before he departs, and spends the night in prayer. On the road from this place to his fleet his friends met him, and prayers, tears, and wailings filled the air. Full of his glory he moved firmly onward: no one but those who have parted with friends to go on long and perilous voyages can realize this part of the scene. Oh! it is true to nature; it is true to the life, humbler life than the proud Spanish don. Many a mother, wife, and sister, at such times, has breathed in spirit the lines of Camoens:

“Curs'd be the man who first on floating wood
Forsook the beach, and braved the treacherous flood !”

But this feeling is soon lost in a nobler one, which incorporates the pride of science and individual heroism. Woman, more than man, delights in glory ; it is, perhaps, that she does not examine so deeply as to see the motives and means, but looks at things in the aggregate or the result ; she feels the national glow that would sink every thing at the thought of honour.

“ While thy bold prows triumphant ride along
By trembling China, to the isles unsung
By ancient bard, by ancient chief unknown,
Till ocean's utmost shore thy commerce own.”

Some of the conceptions in the *Lusiad* are noble ; but honest critics tell us that we are much indebted to the translator of this work into English for our pleasure, the translation being superior to the original. This may be true, but, read as we have it, it is full of beauty and truth to those who see the country while they read the poem, though it must be confessed that there is nothing wonderfully original in the machinery. The poet copied Homer, Virgil, and Ariosto, after the manner of the schools ; but his descriptions are natural, and that is enough. Although this is the epic of commerce, yet I believe that almost every other epic is read by merchants before the *Lusiad*.

It is surprising that commerce and letters should have been so long divorced, as it were ; for they were once closely united. It was the Phenicians who diffused letters over Europe, while they were drawing wealth from the commerce of the world. The schools of the Hebrews

flourished most when their commerce was at the highest prosperity. Letters have at all times been the necessary consequence of commercial enterprise, and from the days of De Gama the difficulties of the navigator have extended the science of astronomy and mathematics. These difficulties are so forcibly impressed upon the mind of the seaman, and indeed upon the mind of every one who trusts himself on the ocean, that I am surprised that any one would go a mile from land a second time without knowing enough of the science of navigation to find a port when he wished. Woman as I am, I never would sail another voyage without some knowledge of this science; enough to make ordinary calculations cannot lie very deep when so many pretend to it.

One great defect of the *Lusiad* was more owing to the laws of the schools than to the want of genius in the writer; this was a disposition to describe all the events, distances, escapes, &c., to the neglect of the natural world. Ichthyology, ornithology, conchology, and all natural history, were then beneath the epic standard. If these would have offended the critic of his day as not of sufficient importance, the voyager would now pardon him if he had descended to the description of the works of nature which were scattered around, and no doubt his copious mind was delighted with them all; but as he was writing an epic, he dared not interweave them with his verse. There is no want of feeling in the *Lusiad*, if there is of minute nature. Camoens was not a favourite of fortune; his name is added to those who live for others rather than for themselves. He had a just idea of the happiness of those minions of fortune who sail smoothly over

the sea of life, and find prosperous gales everywhere, and yet felt what he forcibly described of the unfortunate man :

“ — Through the dim shade, his fate casts o'er him
A shade that spreads its evening darkness o'er
His brightest virtues ; while it shows his foibles,
Crowding and obvious as the midnight stars,
Which in the sunshine of prosperity
Never had been descried.”

It made me almost sick to think of poor Camoens's fate ; that one so talented, so learned, so noble in his feelings, should have died so wretchedly, and found an ignoble grave. I tried to console myself with the reflection that he had been dead two centuries and a half, but could not ; for where genius is impressed on the page, the immortal shade stands for ever before the reader. There is nothing of decay in the thought ; all is fresh and blooming as it was before the ink was dry. Embalmed by the tears of ages, a moving story grows fresher by the lapse of time. To a feeling heart the meeting of Hector and Andromache was but yesterday, and the wailings of Jephthah's daughter still sound in our ears.

Not half so much has been made of Southern Africa and India as might have been made if trade had been free and no monopolies known. It is not only injurious but degrading to say you must not buy here, or sell there, but under a thousand restrictions. The world should be open for all, on equal terms ; the industry of all should be regarded, and no particular set of men ought to enjoy extraordinary privileges, nor any nation be particularly favoured. There are but few places, thank Heaven, where an American vessel cannot go. and but few indeed that they

have not visited. At home we females think but little of national glory, or rather not much of the means of supporting it ; but when abroad we become interested in every thing connected with commerce or naval power. A woman in these distant seas would be as proud to point to a fine frigate or a seventy-four from the United States as she would in dwelling on the fame of Washington, or any other distinguished man of our country. The feeling of nationality comes over us when abroad, but we leave it for others to support when we are at home. A female feels herself lost in the great mass of her countrywomen, but when abroad she represents them all ; and she must be dull indeed if she does not understand this situation. I was the first American woman who had visited some of the places I have described, and being a subject of curiosity, no one could be indifferent to such a situation ; it is not, however, to me a matter of vanity. Our men have been everywhere, but our women have not wandered much from home.

CHAPTER VII.

Departure from the Cape—Sight of St. Helena—Its Appearance at Sea—Something of its History—Landing at St. Helena—Its natural and other Productions—Its Appearance on Land—Strength of the Place—Longwood—Tomb of Napoleon—Reflections at his Grave—Fernandez Lopez—Comparison between St. Helena and Napoleon—Soothing Effect of the Sublimity of the Scripture—Recrossing the Equator—Calm at Sea.

AFTER being well supplied with refreshments, and putting every thing in tidy order, we sailed on the 22d of March, and on the 28th we took the south-east trade-winds, always so delightful after they are settled, and on the 6th of April came in sight of the island of St. Helena. As we approached this "prison-house in the sea," it appeared as a cloud in the heavens; but as you come nearer it assumes a more solid looking form. I gazed upon it until my imagination gave it almost every shape that a cloud could assume, from a whale to any thing monstrous, but never like a weasel, excepting, as Polonius would say, "it is black like a weasel." The next day we anchored in front of Jamestown Valley. I had ransacked all our books on board to get an account of this wonderful island, intending to compare their descriptions with my own observations. It is unquestionably of volcanic origin, and was one of the early productions of Omnipotence in those seas, ages before man had ever navigated them. It was discovered by the Portuguese, those pioneers of navigation, on St. Helen's day, the 21st

of May, 1501, and is about twelve hundred miles from the continent, entirely detached from any other island, reefs, or any thing but the mighty Atlantic Ocean. It lies in latitude $5^{\circ} 40'$ south, and longitude $15^{\circ} 55'$, west. In twelve years after its discovery it was the residence of an exiled Portuguese nobleman, who made some improvements in order to make it habitable. On being restored to favour he returned to his country, and in a few years the English examined it, but did not think it worth possessing until after the visit of Cavendish, in 1588, who made some additional improvements. St. Helen, from whom it was named, was the pious mother of Constantine the Great; and as Great Britain had not entirely lost her partiality for saints, the name was not changed. The Dutch had possession of it for several years before the English, but they did not think it of sufficient importance to their commerce to repay them for the cost they must be at to fortify and retain it. Charles II. gave the island to the East India Company. It does not look half so extensive as it is, probably from its great height, rising, as it does, from the sea in an almost perpendicular wall, from six to twelve hundred feet; but it is more than ten miles long and six broad, making not far from twenty-eight miles in circumference. There are only four openings in the great walls of this castle, and from these full-mouthed batteries are pointed, and artillerists standing by the guns with match in hand. On landing, we ascended by one of these openings of nature, which, although strongly guarded, is made more easy of ascent by art than one could imagine from a distant view of it.

The valley is called James's Valley, and is a

fruitful spot. The fig, orange, date, and pomegranate trees grow in great beauty here, and the usual kitchen vegetables flourish abundantly. The water is good, and can be made to irrigate every part of the cultivated plains. The gum-tree is still common on the island, although many of them have been destroyed; and the lofty cabbage-trees grow in great luxuriance, while the willows seem to hang on the high grounds as though they were clinging to the lowland brooks. A great number of water-fowls hover around the mountains, or coast near the walls in the sea. The inhabitants once tried to cultivate wheat and barley, but at length found it more profitable to raise such articles as would more readily supply the shipping which frequently call there on their return from the India seas.

The place is as wonderful in its history as in its situation, and was once nearly stocked by a colony of those who were burnt out in London in 1666, who in their desperation sought an asylum at St. Helena. James's Valley takes its name from James II., after whom, also, the fort was named. The town is in this valley, and has quite a picturesque appearance. The churches, for there are two, but only one parish, and the snug-built houses perched so high in the air, and yet low compared with heights still higher, give a fine effect to the whole view. An elevated chain of mountains divides the island into two unequal parts; but there are numerous ridges and valleys of greater or less extent among these mountains. Diana's Peak is the highest part of the island, and commands a most superb prospect, for from it you can see every thing on or about the island. The ships look like small craft floating at the base

of this tremendous castle, and the albatrosses, gulls, and other sea-birds, skimming half-way from the sea to the height of Diana's Mountain, make the whole a fine panorama ; one that nature does not often in such vastness and magnificence afford.

What are great guns wanted for here ? and yet in every spot where a cannon can be placed, one of large size is to be found. It would seem that if only a common stone were thrown from these towering battlements, it would sink a ship ; and what could the navies of the world effect against this castle ?

A fine assortment of goods may be found in the shops in this town, and there is much more custom here than one would imagine as he approached the village. I bought several small articles, and priced a number more, perhaps from curiosity. There is a fine aqueduct leading the water for more than a mile in extent, and which brings it down conveniently for the shipping, who often stop to replenish their water-casks, as well as their fruit baskets. Great pains have been taken to make good roads, and the success has been astonishing. Industry and perseverance, with wealth, can almost work miracles. The cattle here, as well as the sheep, are good. The air they breathe is so pure, and their food is so sweet, that the beef and mutton are better than in any other place in the same latitude in the world. The poultry is also very good : chickens and ducks were very sweet and tender, and seemed to be in abundance. The people of St. Helena take great pains to raise them for the use of the garrison, and for the supply of ships that touch here. The place, when I was there, seemed very healthy, yet I did not see a very old person on the island, and on inquiring, I could not find one verging towards

a hundred years of age ; which is not an uncommon thing in our own country, where we suffer from every change of climate, from the extreme of heat to the extreme of cold. The air here, in the upper regions, is mild, not rising much above summer warmth, and the changes in the climate vary but a few degrees from one season of the year to another.

Longwood is on the north-east side of the island ; it is a plain, raised seventeen hundred and sixty-two feet above the surface of the ocean, and abounds in vegetation of various kinds, but there are times when beef is high, when large India fleets arrive at the island. The birds are not so various or numerous as at other islands I have visited, but the canary is here, as in other places, a sweet songster. The canary is a delicate, yet often a hardy bird, and will live long and in good health if taken proper care of. In this island they are too common in the groves to be an object of attention among the tasteful ; but it must be confessed, after all our discussions upon slavery, that a good canary-bird in a cage, educated by man, is a more beautiful singer than those who live in the retreats of nature. They may be taught from various instruments of music, and made to surpass nature by the assistance of art.

I had seen so much of natural scenery, and had so often attempted to describe it, that I should have visited St. Helena without emotion, notwithstanding all its wonders, if it had not been for the sentiments inspired by the place. This, it may easily be supposed, was the idea that the Emperor Napoleon was for several years confined here, and that his ashes were now entombed here.

There was something in this that seemed to exaggerate the grandeur of the scene; something that gave it a deep and solemn cast; that blended the moral, historical, and wonderful with the natural. When I first visited Longwood, I took no more notice of the beauties of nature than I should of the richness of the furniture in a room where a dear friend was laid out for burial; but after a while, when my first impressions had subsided, I could enjoy the beauties of the scene, as well as contemplate the history of him whose name has conferred immortality on this secluded spot.

I sought the tomb of Napoleon. There was an iron railing around a flat, dingy-coloured stone, which was raised a few inches only above the surface of the ground. A wooden railing encloses the iron one, and within the former three large willows overshadow the grave. We marched up to the spot, took a twig of willow, and ordered one of our attendants to bring us some water from the spring whence the mighty emperor drank daily. It was sweet water, and as I drank, I thought of what old Cotton Mather said in his works:—all the great virtues of cold water will not be made known to us for a thousand years to come. It tasted sweeter to his fevered lips than royal Tokay, or the still scantier drops of the grapes of Shiraz.

As I bent over his grave, all the marvellous events of his life came fresh into my mind. Born on an island, he died on an island: both birth-place and burial-ground had been famous in history, while he was more famous than all. I saw him a spirited cadet; then a proud subaltern; a general in Italy; a commander in the Levant,

looking up to the Pyramids to catch glory from their proud antiquity, and breathing it through a sensitive French army. I followed him through these fields of blood, until I saw him disperse the corrupt legislature of France, and commence what philosophers called the parallelism of the sword; his proud spirit growing still prouder until all the crowned heads in Europe and the world cowered and bowed before his august presence. He was then in his saloon; maps of empires were before him, and he drew levies of kingdoms as if in sport. I saw him placing the diadem of France upon his brow, and still restless until the iron crown of Italy was his also. Empires fell before him, as if fearful of his step, and ambition took entire possession of his whole soul. I then saw the magic thread of his destinies riven, when he repudiated Josephine and became allied to the house of Austria. The genius that had guarded him to a hundred victories was capricious in Spain, and deserted him at Moscow. At Waterloo the destinies were against him, and his fate was to die in this remote prison of the ocean, and sleep under the humble stone which was now before me.

That a man whose nod gave law to nations should be at rest in this quiet little place seemed to me indeed as a dream. It is a good place, thought I, to reflect upon the value of human life and the instability of fortune. My reflections were made upon the stone itself, for I was enabled to get within the railings and take a position which few could enjoy. I made many inquiries respecting his treatment while here, but the good people were not inclined to say much about it.

I found, however, that Sir Hudson Lowe was not a favourite with them; and my inferences, added to what I had heard, satisfied me that some little insults, to say the least, were offered him, but not from the people, for they now speak kindly of "General Bonaparte," who was liberal to all those allowed to approach him. He came to this place a fallen man; and there was but little of that reverence the world pays to genius and greatness ever felt for him at St. Helena. The people were not so well pleased to think that their island would hereafter be considered as a prison.

Most of the people, I found, felt towards him as Byron did when he wrote—

"Ill-minded man! why scourge thy kind,
 Who bow'd so low the knee?
 By gazing on thyself grown blind,
 Thou taught'st the rest to see.
 With might unquestion'd,—power to save,—
 Thine only gift hath been the grave
 To those that worshipp'd thee;
 Nor, till thy fall, could mortals guess
 Ambition's less than littleness!"

Thanks for that lesson!—it will teach
 To after-warriors more
 Than high philosophy can preach,
 And vainly preach'd before.
 That spell upon the eyes of men
 Breaks never to unite again,
 That led them to adore
 Those pagod things of sabre-sway,
 With fronts of brass, and feet of clay.

The triumph and the vanity,
 The rapture of the strife—
 The earthquake shout of victory,
 To thee the breath of life;
 The sword, the sceptre, and that sway
 Which man seem'd made but to obey,
 Wherewith renown was rife—
 All quell'd!—Dark spirit! what must be
 The madness of thy memory!"

The house in which the emperor lived is now converted to the uses of a granary or barn, and I believe that there are horses stabled there ! but whether this was accident, or pitiful design, I could not discover ; it could not certainly have been from any order of government, for they built him a new and convenient house, to which he would not remove. He felt that the death-fang was on his heart, and that all would soon be over with him. If he had not had a disease of the breast, to which physicians give an anatomical name, one was seated there that must have bowed him to the grave sooner or later, and that was disappointed ambition. To one who had never felt the intoxication of power and dominion, and whose bosom had no wounds of pride or conscience, it would be hard to be confined in this eagle's nest for many years, with the certainty that there was no escape.

For several years after Napoleon came here it is thought that he indulged hopes of being released, probably by some convulsion in Europe ; but finding France quiet under the reign of the Bourbons, and still at peace with England, he lost all hopes, and the canker on his heart began to increase in malignity, and to give strong prognostics that he would die before his son should be of age, or Europe would engage in a general war. He was seldom heard to complain, but there was a settled disdain upon his noble brow, and his lip would curl with scorn as he beheld the proud ships of his jailers passing to and from his castle.

The conversations of Napoleon, which have flooded the reading world, were, no doubt, in part authentic as they came from his lips ; but it is

questionable whether he was indulging in his own reveries, or sporting with the credulity of his listeners. It is said that he seldom mentioned his wife; whether he thought that she was wanting in affection in not offering to accompany him in his exile, or whether he never had any affection for her, is not known. Those who analyze the passions would perhaps say, that no two mighty passions can exist at the same time in any mind; ambition, they say, will destroy avarice and love, and the latter has been known to master both the others. All the communications he could make to his friends were verbal ones; the eye of the police was too vigilant to permit any others to escape from the island.

The good people of St. Helena are quite astonished at our enthusiasm for the character of Napoleon. They say "he was no friend to republics, nor ever discovered any partiality to the people of the United States; that he loved all the trappings of royalty, and spurned every thing that did not partake of aristocracy." Our only answer to this was, that we neither feared nor hated him; and that we could view him as a wonder in the history of man; as something above the ordinary dimensions of nature; a chastiser of nations, some of whom deserved their chastisement; as a lover and patron of the arts and sciences, and a protector of men of genius; as a destroyer of the last remnants of the feudal system; and finally, that many of us viewed him as an instrument in the hands of God to promote unforeseen good to men, as the two mighty Roman emperors paved the way for the coming of the Messiah; and, in short, that every thing great was intended by its

Maker for some great end. But after all, I was never entirely satisfied with my own excuse for my enthusiasm for this great man; and perhaps his noble physiognomy might have made a part of my admiration, for in every picture, or bust, or statue of Napoleon, whether young and spare, or grown older and corpulent, his countenance is one of the noblest ever formed.

To this sea-girt castle his name is not so dear as the exile who inhabited it more than three centuries ago. Fernandez Lopez had enjoyed wealth, fame, and power; but having lost all but honour, fled from the Indies to this retreat, and began to plant, and sow, and prepare it for the abode of his fellow-men. He bore his exile well, and after a few years his fortunes changed, and he came again into favour and prosperity. If all traces of his civilizing hand are now obliterated by deeper marks of improvement, still the contemporary of Columbus, and the philosopher in misfortune, is remembered as one of the benefactors of mankind.

We now took the fine road to Jamestown, about two miles and a half, and left St. Helena on Saturday, the 9th of April, steering north, with a delightful breeze. I kept my eyes directed towards the island, still thinking of the mighty dead. The place, on the whole, seemed in my mind a fit one for the tomb of Napoleon; for there was something analogous between St. Helena and himself. The mighty mass of stone was an instantaneous creation by volcanic power; and Napoleon arose at once by an eruption in the political and moral world. The French revolution threw him upward, and he bestrode the nations as a colossus. They had not done won-

dering at his fortunes when his reverses overtook him ; but sudden as was his elevation, his fame will last as long as the rock on which he lies. History has already placed him along with Cæsar and Alexander ; and if the grave philosopher shall in future times ask how much he has done for the world, and sarcastically add,

“ He left a name at which the world grew pale,
To point a moral, or adorn a tale ;”

still Napoleon will be a subject for young-eyed wonder, and his deeds and his fate will furnish the schoolboy declaimer with matter for a thousand years to come ; and the historian, when he comes to his age—an age indeed of surpassing events—will kindle with some of the enthusiasm we now feel at the mention of his name.

St. Helena has become a resting-place for the ships which traverse the Indian Ocean, and it is said that not less than one hundred and fifty of them arrive there in a year. Those who visit this island will hereafter, as they have done ever since Napoleon's death, perform pilgrimages to his grave, as our classic travellers in Italy seek for the tombs of Cicero and Virgil.

Our minds after leaving a magnificent scene, or contemplating the achievements of a hero, experience a void that gives a restlessness to our spirits difficult to subdue. The best cure for these feelings that I could ever find when at sea was to survey the immensity of waters, or turn to some of the sublime or touching parts of the Scriptures. The contemplation of justice, mercy, and truth soothes and settles all our agitations ;

and there is a beauty in holiness which, when we become enamoured with it, occupies all our heart, and absorbs all minor interests. As eternity is beyond time, so are these subjects beyond those that lie in our pathway through life. There is something for ever so new in the Scriptures that no human mind can feel satisfied of having reached near their full meaning. Some new thought will spring up in every text for contemplation. I do not believe there ever was a mutiny on board of a ship where the Bible was read diligently by the whole crew. Works of fancy and taste after a while grow tedious, from absorbing too much of our attention at once, while the Scriptures are not only interesting, but compel us to direct our reasonings and views to ourselves. If there ever was a book which could be called an awakener of our own thoughts, it is that which furnishes so many thoughts for us, the Bible. I have read it where Christianity was professed, followed, and held the highest claims to attention; I have read it where superstition abounds, and where infidelity, pagan infidelity, darkened the whole land: it was the same heaven-illuminated page everywhere; but if ever peculiar glory rested on it, it was when we were near those who had never received its glad tidings, and who never knew the true God.

On the 19th of April we crossed the equator, but we were now all such old, experienced sailors that Neptune did not think it worth while to pay us a visit, nor did we expect him. If he had come on board he would have found our stock of liquor nearly the same as when he saw us before, except a little which had been used as medicine; and if he had brought his log-book, as sailors

playfully say he keeps, of all bad deeds done during his absence, I question whether he would have found a single oath recorded, or one vile or blasphemous expression set down to any one of the crew of the Antarctic; and, heathen as he is, he would have been delighted to know how much time they had devoted to reading the Bible.

We had now many calms or baffling winds. There is nothing so distressing as a calm at sea. Lying like a sleeping tortoise upon the water, the vessel that in other times seems to partake of life, now loses all animation; or if there be a slight motion, it is a sea-sickening sort of one. The sailors are torpid, for it would be cruel to set them at hard work under a tropical sun, and they lie about as creatures without soul or spirit. In such a situation the nights are restless, and the days seem almost endless, although they are only about equal in length to the nights. All that memory can furnish, that books can supply, or conversation offer, is nothing. Everybody feels sick or dissatisfied, and you see yourself reflected in every face. You cannot laugh an hour away; and if you smile at all, you smile like Cassius, who scorned his spirit that could smile at any thing. If, gentle reader, you have an enemy, never wish him any thing worse than a calm at sea. The sun seems to rise in wrath, and set in fiery indignation, when one is under the equator, or near it, becalmed. Every thing was changed but my husband's patience, which was proof against all. He had before experienced the evil, and had learned how to support himself under it. What must be the sufferings of those who are in want of good and wholesome water at such times? We, thanks to Heaven, had a good sup-

ply of both water and provisions; and still these calms were dreadful. The tales of distress which we have read at such times, however horrid, were, I believe, only half told. The inhabitants of Judea never panted for rain as we did for wind, when the prophet prayed for it and the little cloud arose. At length, on the 13th of May, we took the north-east trade-winds, and were wafted along so sweetly for eighteen days, when we arrived at Tercera, that the whole time seemed hardly as long as one of those days in the calm.

CHAPTER VIII.

The Azores—Climate and Soil—Volcanic Origin—Liberia—Character of that Colony—Lot Cary—Effects of Exploring Expeditions—Missionary Societies—The bad Effects of Intoxicating Liquors—Indians unacquainted with Intemperance until taught by Europeans—Course that should be pursued by Missionaries—Intellectual Character of the Indians—Their Ferocity ascribed to Ignorance and Ill-treatment—Arrival at Cadiz—Disappointment in not being allowed to Land—Slight Sketch of its History—The Cholera—Notice of it in New-York.

TERCERA is one of the Azores, which group is nine in number ; some writers make more of them, by taking into the account some large rocks, but there are only nine islands of consequence, the principal one of which is called Tercera, measuring twenty-five miles in length, fifteen in breadth, and about fifty-four in circumference, the figure being, of course, rather elliptical than circular. This group lies in the Atlantic Ocean, about 36° to 40° north latitude, and from 25° to 35° west longitude. The Portuguese took possession of these islands in about 1446 ; some historians fix the date earlier and some later, and no precise time can be fixed for their discovery or possession. In former ages nature appears to have been at work in raising islands by volcanic power ; but in later days she seems to have lost her vigour, or is disposed to quit her labours, for no island of importance has been thrown from the deep beds of

ocean for the cultivation of man since the discovery of these islands by the Portuguese. The soil is productive, and oranges and grapes grow in great profusion. The climate is healthy, and though earthquakes sometimes terrify the inhabitants, still it is seldom that they cause any essential injury. It is the opinion of some philosophers that these islands are supported by volcanic arches, whose vast ovens are burning with perpetual fires; this is no very comfortable thought for those who keep it in mind, but the inhabitants here think this the garden of the world, or at least the place where it might be made; and it is most assuredly true that a finer climate can hardly be found than that of the Azores. The government, though arbitrary, is mild, and I could find no instances of oppression. These islands were once supposed to belong to Africa, by geographical position, but of late years they have been classed as European, for it is certain that the new race of inhabitants are Portuguese. Portugal has always held them in affection, because they were first known to them in modern times, and have been constantly under the protection of that government.

The whole island of Tercera, as far as I could see it, and we made frequent tours into the country, is but an exhausted volcano. So far as I have seen the islands of the sea through more than three hundred degrees of longitude, they appear to have been brought forth by volcanoes in the oceans of the east and west. It is true that they are at work now, but they must have been more active in former times than at present.

The Portuguese here are a quiet and inoffensive

people, but they are hardly acquainted with the growth of our country; they still think that we are in our infancy, as they measure all growths by length of years. They had heard of our settlement on the coast of Africa, and spoke of it as a feeble attempt to get rid of our surplus black population; they think it will not last long, but we indulge in other hopes; and I feel persuaded that this is one of the most important colonies ever planted since the settlement of North America. Its climate is as healthy as any we have ever known, notwithstanding the location. The settlement has flourished as well, and is increasing as fast, as did any of the American colonies, and their commerce is greater in proportion to the number of inhabitants. None are more attentive to the cultivation of mind and morals, and their territory is unbounded, for the tenth part of Africa is not at present under cultivation. Most of this fifth part of the globe is wild as it was when the beasts of the field and birds of the air were its lords-proprietors. I can see nothing to prevent this colony from being the nucleus of nations; flourishing in arts and sciences, in commerce, in civil freedom, and all that constitutes a state. What can be more rational than these noble efforts to advance the interests of man, particularly degraded man? My nation and people are now doing something to wipe off a dark spot from their escutcheon.

If this colony is cherished, the United States will reap the advantages of it; they will get rid of their surplus population of blacks, and at the same time be planting a colony from whence great commercial results may be expected. I con-

ceive that there is to be a change in a great portion of the globe, and that change will take place speedily. The agents and governors of the colonization society have been men of talents and perseverance : the most remarkable man, however, among them, was an African. The Rev. Lot Carey, who died not long since at Monrovia, was an extraordinary man. While he was a slave in Virginia, by his own industry and anxiety for knowledge, he learned to read and to write, and acquired so much general information that he was intrusted with the management of a large tobacco warehouse. In this business, by his perquisites and his industry in the time allowed him, he accumulated a sufficient sum of money to purchase, not only his own freedom, but that of his wife and children also. He was discreet, sober, and religious, and became a preacher of the gospel while yet a slave. Many who heard his discourses thought his views of the Bible were excellent. When the colonization society was formed, and Liberia purchased, he was ready at the commencement of the settlement to depart with the earliest settlers, and took his share in every labour. He acted not only as a spiritual guide, but as a civil magistrate, as deputy agent, and for a while, in the absence of Mr. Ashman, as chief magistrate of Liberia. In every situation which he was called to fill, he not only evinced the high powers of a gifted mind, but the pure spirit of a righteous man. If such specimens of intellect and virtue can be found rising up among slaves, what may we not expect from these people in a state of civil and religious freedom, enlightened by schools in every branch of knowledge ?

This must be effected by exploring expeditions,

by missionary societies, and by a universal temperance, which is rapidly pervading the whole population of the globe. These exploring expeditions should be got up by individual enterprise, assisted by government. Their failure the government will not be answerable for, but their success must of course be a national benefit. According to the present law of nations, discovery gives the right of possession, so far as it relates to any other power than the aborigines; if this should be considered of consequence, certainly the trade of lands discovered would for some time be of advantage to our commercial people. It were well, too, that we should do something for the world whose commerce we enjoy; we have now a name to support, and what have we done to raise its glory? Our whalers have done something worthy of remembrance, but this is all. To Nantucket, New-Bedford, Stonington, and a few other places, is most of the credit due for all the discoveries we have made in the Pacific Ocean. These enterprising men have traversed every sea in search of whales, and they have generally communicated to the world what they have found new or profitable. When the government has wanted information, they have been ready to communicate it from their very accurate and satisfactory journals; if no advantage has been taken of their discoveries, it is not their fault.

The next step to finding where savage men live is that of furnishing them the means of instruction; and this can only be done by sending enlightened missionaries to teach them civilization and Christianity. Wherever an intelligent missionary establishment is to be found, there good results have been witnessed, notwithstanding the

abuse of some, and the fear of others; there is no exception to the rule. Civilized nations have heretofore carried intoxicating liquors to those they visited, and while they opened up the light of mind and religion to them, have taught them the vices found in corrupt associations of the civilized world. The poor wretches had acquired all the vices before they had been taught to practise a single virtue that they had not before known; thus civilization has heretofore been to them a curse instead of a blessing. But now it is otherwise; the refinements of society are taught them without its vices.

Ardent spirits have in general been an article of traffic in these regions, and the poor wretches have been cheated by proffering to their lips the intoxicating draught. It is the sweet recollection of our little voyage that we have never offered to the lips of primitive man one drop of ardent spirits; we have met them and drunk the waters of their springs, and never said to them that there was any thing that an Indian would like better. I never saw an Indian inebriated, because we never gave him any thing to steal away his senses. It has been, as far as I am informed, the universal practice to carry ardent spirits to the people of these rude islands, and the baneful effects no one ever doubted while engaged in the traffic. Why should it not be made a penal, as it is a moral, offence to teach them drunkenness? There is a new and a better era to come than has as yet been known; for even the pilgrims of New-England gave the aborigines these strong waters in traffic. The visitors to these benighted regions should never let them

know that such a thing as a drunken man ever existed. It is said by some that they already have inebriating draughts among them; but this is true only to a certain extent, and that a very small one. They seldom make use of narcotics, or of any thing that entirely destroys their senses. The process of distillation they are unacquainted with, and but few simple juices are very inebriating. Of all the natives unaccustomed to Europeans, I never saw one who had any marks of intemperance about him. Travellers may say what they please of these natives in regard to intemperance, but they never bear any of the marks of it until they become acquainted with civilized man. The ava-root and other narcotics produce a stupefaction, but they leave no blotch, no laxity of muscle, no disgusting redness of the eyes, and all the wretched symptoms induced by the use of ardent spirits.

Missionaries, who should be at first schoolmasters, and then preachers, should be sent to every isle of the sea as well as to the continent. Letters should be first taught, with domestic arts; and then the high principles of morality and religion. If day-schools for children, and Sunday-schools for men, women, and children, should be established, I firmly believe that the work of refinement and morals would go rapidly on in any of those islands which we have visited, and which are now in darkness. The natural capacity of these savages, I believe, is not inferior to that of any people in the world. It is, I think.—I go to no theorist for the doctrine,—a law of nature, that wherever there is a fine physical organization among mankind, there mental capacity will be found also. This may be a mortifying

doctrine to proud man in the old clans, tribes, or nations, but it is nevertheless true. I believe there is as much genius in some of the islanders we saw as can be found in France, England, or America. These new regions hardly ever see

“The tenth transmitter of a foolish face;”

but the natives are quick of perception in all the ordinary duties of life, and are also acute observers of passing events; they compare and combine most rapidly in every instance where they are called upon to act. I do not believe that He who made man has given any particular gifts to any one race. If there be any superiority, it is in giving to some of the islanders we saw a larger corporeal frame than to any race of men which history has ever enumerated. The progress of the improvement of these people depends on us; and we shall be answerable in future for the intelligence and virtue they shall possess. Much may be done at a little expense, for there are persons of good education who are willing to settle at these places if they could have the protection of government and the assistance of the charitable in their exertions. The English will in a few years be the language of all the islanders where English or American missionaries are established; for as soon as the natives become more enlightened, they will find that their own scanty language will be insufficient to express their ideas; and picking up a little English from common intercourse with those who have come to teach them, they will be anxious to gain something more from day to day until they become proficient in English literature. They are,

as I have said, imitative, and of course soon learn to write well ; the chirography of Pomaré, which has been shown in the United States, was elegant—such as a professor of penmanship might be proud of. The missionaries are, at least all that I have seen, satisfied with the quickness and assiduity of the natives, and also with their docility when they become impressed with the idea that they are receiving some benefit from instruction, and that their teachers have no other object than to do them good. The missionaries should have nothing to do with trade ; that must be left to others ; for if these people once get the idea into their heads that the missionaries are labouring to gain wealth, that moment their influence is at an end, and their only protection will be a resort to arms. It is not from a sanguinary disposition that the natives make attacks on vessels that visit them, but from a desire to obtain what others have at the easiest rate.

On the 10th of June we arrived at Cadiz. The harbour is a noble one ; the city is one of the finest in Spain, and, if properly garrisoned, must be capable of sustaining an obstinate defence. I make these observations, begging the reader to understand that I know, or think I do, which is perhaps of quite as much importance, a good deal about the subject of defence, from hearing an almost perpetual conversation about the capability of defence of one place or another in parts of the world where there were no guns or castles, as well as in those which were strongly fortified. In this bay rode the proud navies of Spain in every age of Spanish greatness, from the invincible armada to the time Villeneuve sailed to be beaten at the battle of Trafalgar. This was the rendezvous of the navies of the New World,

The Earl of Essex, the favourite of Queen Elizabeth, took this city in 1596; it has sustained several sieges, but was taken by the French in a late period of history. It is an old city, and no doubt is full of those things that interest a traveller whose views are directed to objects less superficial than those which strike the eye of the common observer. Our tastes change with our experience: at first we look at whatever stands most prominent, such as great and magnificent buildings, or striking peculiarities of the people; but we afterward direct our attention to more minute matters, which do not lie on the surface, and in all probability find more satisfaction in these researches than in gazing at what everybody sees, or has examined. But I was deprived of the pleasure of describing this city, as we were not permitted to stay there. This was at first surprising to me, for I could not conceive of any cause why I should not see the people of Cadiz; and I grieved the more at it, as I had informed my female friends at Manilla that I was to visit Cadiz, and therefore was under various commands from them to some of their friends in the city. We were not permitted to stay in the port when it was known that we had come from Manilla many months before, and that the cholera was there; our journals, also, showed that two of our men had died of this disorder. The authorities were very peremptory on this point, and threatened to fire into us if we did not depart instantly. This was silly as it was timid and arbitrary; for after so many months, if the disease had been contagious we were free from any infection, and could not have communicated it to the people of Cadiz. When we bring matters home to us,

how much better do we reason than when our remarks are general. How ridiculous were these quarantine laws to us, who had been out of danger over the distance of nearly fifteen thousand miles of ocean ! Not having a single man sick of any contagious disease, nor of any other, except accidental indisposition, we were forced to leave this port without discharging a particle of cargo, and to direct our course to Bordeaux. The sickness called the cholera, it is true, had been on board of our vessel, and carried off two of the crew, but those who early made known their sickness to my husband and myself were cured ; these two were beyond assistance when we were informed of their sickness.

This disease did not then appear in my eyes as it since has. I considered it entirely an Asiatic disorder, and one that would be confined to that country. It had passed from the Hoogly and the Ganges to Manilla, and was fatal among the lower classes of society, but was by no means confined to them ; still the higher classes in Manilla thought so little of it, or rather, perhaps, said so little about it, that I did not think much of its deadliness. The mortality among our sailors was less than usual, and therefore their deaths by this disease made no very deep impression on my mind. It was only after we were denied the hospitalities of Christians that I began to reflect on the selfishness of people in their fear of an epidemic.

I was aware that this sweeping disorder had entered Europe by way of Astracan, and had been very deadly, but little did I think it would ever spread over my own dear country ; causing so great a panic that for nearly a mile in the principal street of New-York, at noonday, not half a

dozen people could be seen. Desolation had extended over all my native city; and while looking over my journal to prepare it for publication, every hour the house was filled with bulletins of the progress of this mighty scourge of mankind. The different symptoms and the different treatment were sufficient to distract every one. It was difficult to know what course to pursue when a person was attacked; and until the disease was far advanced, it was almost impossible to tell whether the patient was sick with it or not. The symptoms were almost as various as the patients; cramps, diarrhœa, and occasional spasms are general premonitions of the disease; no headache or dizziness marks its coming on, but rather, like the apoplexy, its forerunner was a high state of animal spirits. I never left New-York during the whole time it was raging in the city, and had an opportunity of witnessing its disorganizing effects on society, as well as the sufferings of those whom it has attacked. The deaths were numerous, and the disease came as a thief at night; but the disease, and even the deaths, were nothing to the alarm. This spread through all circles, and seemed to be a disease of itself, more malignant than the cholera. The constituted authorities did much, and the rich subscribed large sums of money, but if individuals in common life had not made exertions, personal and pecuniary, the sufferings would have been more intense than they were. Such sweeping calamities have a sad effect in many instances on the human mind; they dry up all the generous currents of the heart, and destroy all the wholesome ceremonies of burial and funeral honours. Although there are frequently unne-

cessary expenses attending a funeral, yet there is something dreadful in having a friend die in such a manner as to be hurried to the grave as a vile suicide who had no objects or wishes to live for. To have a being whom we love this hour well—sick the next—dead the next—and hurried to the grave before his ashes are cold—is too much for human nature. I believe if every one was obliged to live in the city during the rage of the sickness, that many evils would be avoided. The natural ties between the rich and the poor and the middle classes of society would not be sundered; one could give relief to others, and all, depending on Heaven, would go on as usual in most things. The great evils of this disease have sprung from alarms; fear has slain more than disease itself. In future days the folly of flying from the cholera will be evident to all, and the great mass of the inhabitants of every city will come to the truth with the fact—

“I ran from trouble, and trouble ran and overtook me.”

All the individual miseries which have flowed from the cholera will never be known. The tears and prayers of widows and orphans have had their influence with the God of mercies, and another scourge may not, perhaps, overtake them. This disease has touched the rich, but it has dwelt with the poor; it does, indeed, sweep off vice, but it does not keep always with the vicious; the temperate, the abstemious, the cautious, and even the extremely scrupulous have fallen victims to its ravages. “*Be ye ready*” is a maxim for all who live among men.

CHAPTER IX.

Arrival at Bordeaux—History and Description of the City—Delight at seeing the Flag of our Country—Literary and Scientific Institutions—Visit to the Tomb of Montesquieu—Comparison between Montesquieu and one buried in Trinity Churchyard—Sketch of the Archbishop of Bordeaux—His Residence in America—His Popularity there—His Charities—His Return to France—His Popularity in his Native Land—Reception of a File of American Newspapers—The Pleasure they gave—American Books—Their Authors—Farewell to Bordeaux.

ON the 20th of June we arrived at Bordeaux, which lies in longitude $0^{\circ} 34'$ west, and latitude $44^{\circ} 50' 13''$ north, and is the chief city of the department of the Gironde. It is built on the left bank of the River Garonne, that is, the left bank after military language, which I have discovered is different from naval usage. Military men speak as going down a river, and naval as sailing up. In consideration of the loyalty of this city, Louis XVIII. built a bridge across the river, which is seven hundred feet in length and is thrown into seventeen arches, and has a fine appearance. This was the first time I ever had an opportunity of visiting what might be called an ancient city. Those I had seen did not exceed three hundred years in age; this was founded so early that the precise age of it is not known. It was known to the Romans in the days of Cæsar, and in the fifth century it was taken by the Goths in their sweeping march of destruction. It was destroyed after this by the Normans, but as it was

a convenient place for commerce it soon rose again from its desolation, and was considered as an important city. It came into the hands of Louis VII. by his marriage with the daughter of the Duke of Guienne. The king was soon divorced from his wife, and she reserved the city and country around; but in 1152 she married the Duke of Normandy, who afterward became King of England. The antiquarians here pretend to show the precise spot where the King of France, when he was made prisoner by the Black Prince, was confined for more than ten years. In a few years after the memorable feats of the Maid of Orleans, the city was restored to France; and in about a century after this, it was nearly destroyed by a rebellion of the people on account of some arbitrary taxation upon salt, which article was much used there for preserving their provisions for vessels. It was a place of great consequence to France, and was protected in its commerce by the Bourbons, and in gratitude remained true to the royal cause during the revolution of 1789, for which it was severely punished by the furious republicans of that day. They were the last to yield to the revolutionists, and the first to hail the restoration of the Bourbons, when they returned from their long exile. The city has all the marks of antiquity about it; there are some pieces of masonry there that probably were laid before the Christian era. The number of inhabitants is probably not greater than it was a thousand years ago—not exceeding one hundred thousand. To an American the walls give the place a heavy appearance. There are nineteen gates in these walls, and every thing about it looks as though, in former days, the inhabitants were capable of making a formidable resistance, particu-

larly before the invention of gunpowder. The suburbs of the city are delightful residences. The inhabitants are nearly all Catholics, there being forty-six Catholic churches and but one Protestant in the city; some of these edifices are noble buildings, though they are not all in the best repair. Bonaparte built a palace here about the time of his Austrian alliance, perhaps rather to conciliate the people than with an intent of residing in it any considerable portion of his time. He wished to eradicate from the hearts of the people all affection for the Bourbons, and one way of effecting this was to display the munificence of the new government. This was not bad policy, but proved of no avail; the attempts he made to benefit France, and they were not a few, were all destroyed by his Spanish and Russian wars, in which the elements fought against him as well as men. The harbour is well protected by forts, and looks much more lively with the shipping of all countries than the city does; and to me the most cheerful sight was that of the American flag flying more frequently than that of any other nation but that of France. To one long from home it sends a summer feeling to the heart to see the flag of our country, long respected for the enterprise of our merchants, but now for the glory of our victories. I rejoiced that this flag had not only been consecrated by bravery, but commemorated by the muse; and I could not refrain from repeating, as I saw it waving from the tall masts of some of our noble vessels, a few lines of one of the poets of my native city:

“Flag of the seas! On ocean’s wave,
Thy stars shall glitter o’er the brave,
When death, careering on the gale,
Sleeps dankly round the bellied sail.”

And frightened waves rush wildly back
Before the broadside's reeling rack.
The dying wanderer of the sea
Shall look, at once, to heaven and thee ;
And smile to see thy splendours fly
In triumph o'er his closing eye.

Flag of the free heart's only home !
By angel hands to valour given,
Thy stars have lit the welkin dome,
And all thy lines were born in heaven !
For ever float that standard sheet !
Where breathes the foe that stands before us,
With freedom's soil beneath our feet,
And freedom's banner streaming o'er us !"

This is part of an old ode written while the war fever was upon us : to have made it perfect the writer should have seen that flag made glorious in the bosom of peace, as it then floated before me.

The whale-fishery is carried on here, but the commanders of these whale-ships are mostly Americans, as in fact are the seamen. An American whale-ship is a little empire, and generally one of the best regulated ones. Every one has a share in the profits, and his fortune and reputation are at stake. This works wonders : no people are more hardy than these men, and none have been more prosperous in their business. I was sorry to hear that the sand was accumulating at the mouth of this harbour, but as human ingenuity is now busy to find out some remedy for such evils on both sides of the water, I trust it will be one of no great continuance.

The museum is large, but did not abound with as many curiosities as I expected from its age. The library of the Academy of Sciences was the largest I had ever seen. There were some splendid editions, but not many in comparison

with the whole number of volumes. The academy of the deaf and dumb is in good repute, but I had no opportunity of seeing a display of the pupils. In every part of the city there is something of the bustle of business, but more particularly at the gates opening towards the river; but these places are not much visited by ladies. I went to the church of St. Bernard to see the tomb of Montesquieu, who was born in the neighbourhood of this city, and buried here. The French have a great reverence for his memory, and from the enthusiasm with which they speak of him, one would think he was some Lord Byron or Thomas Moore, who had written poetry until every lady's head was turned with it. My companions could not inform me what he had written, but only that he was admired by every good Frenchman. At length I found his book on the Spirit of the Laws, in English; and as far as I could judge, he deserved the reputation of a great man: but I still wonder how he came to be admired by the French ladies, except because it is a fashion among them to admire great men. I wish this was the fashion in our own country, but I fear that thousands of our New-York ladies pass by Trinity churchyard, in Broadway, without knowing that a greater man than Montesquieu has a monument there; the monument of one of whom it might be said—

“When on a rock which overhung the flood,
And seemed to totter, commerce shivering stood;
When credit, building on a sandy shore,
Saw the sea swell, and heard the tempest roar;
Heard death in every blast and in each wave,
Or saw, or fancied that she saw, her grave;
When property, transferred from hand to hand,
Weakened by change, crawled sickly through the land;

When mutual confidence was at an end,
And man no longer could on man depend ;
Oppressed with debts of more than common weight,
When all men feared a bankruptcy of state ;
When, certain death to honour and to trade,
A sponge was talked of as our only aid ;
That to be saved we must be more undone,
And pay off all our debts by paying none ;
Our Country's better genius, born to bless
And snatch our sinking credit from distress,
Didst thou step forth, and, without sail or oar,
Pilot the shattered vessel safe to shore."

The present Archbishop of Bordeaux, John Cheverus, was for many years an inhabitant of the United States. During the reign of terror, in 1793, being then a young Catholic priest, he fled to England, and from thence embarked for the city of Boston, in company with a very estimable man, much his senior, the Rev. Dr. Mattignon. In Boston these priests built up a flock, and were in the way of doing much good. When a bishop of Boston was necessary for the Catholic church, Dr. Mattignon urged that his young friend should be appointed in preference to himself. As bishop he became the most popular man in that city among all denominations. He was on good terms with every sect of Christians ; he was not only polite, affable, and kind, but was unceasing in doing, wherever he was called to labour, among the sick or the poor : nor were his exertions confined to these ; he was the confidant of many in the higher circles of life in all denominations ; probably no man ever lived in Boston more generally beloved. After twenty-seven years' labour in the United States, he was appointed by Louis XVIII. Bishop of Montauban, and requested to leave the United States as soon as possible. At first he declined the appointment, preferring to

live in his own humble way in Boston to changing it for the parade of a bishop's life in France, but the request being repeated, as it is said, by the king himself, and his health not being good, he came to the determination of leaving America for France. The separation from his old flock, and from his other friends, was painful indeed. When he reached Montauban, the Protestants vied with the Catholics to do him honour. He hailed them all his friends, and was ready to do them any service in his power. He had soon an opportunity to show some further traits in his character. There was a great freshet, which caused the rivers near Montauban to overflow their banks and endanger the lives of the farmers. He called all the active spirits of the city together, put himself into the smallest boat, and led the way to assist those in jeopardy. He brought hundreds of them to the city, opened his palace, and lodged and fed them until the waters had abated. Not content with this, he sent men to save the cattle and other property of the dismayed inhabitants, so that, through his firm and generous conduct, but little loss was sustained. The king, hearing of this, and knowing that his finances were not in a very flourishing condition, sent him a very considerable sum of money, of which, however, he did not retain a cent, but distributed the whole amount among those who had suffered the most by the flood and had the least left. His fame was so generally known, that when the old Archbishop of Bordeaux died he was appointed, as it were by universal acclamation, to fill his place. He was then made by Charles X. a peer of France. This office was not given to him because he wished it, but the king thought

he would bring a good share of influence into the chamber of peers. It was known that he was a well-read civilian, and watched the progress of the institutions of the people of the United States with great care; but I believe he never took an active part as a politician, for his whole soul was in his religious duties. It is seldom that an archbishop preaches, but he set the example to his higher clergy by preaching and exhorting often. While we were at Bordeaux his liberal views in politics and religion were often spoken of; not that he was ever suspected of a want of sincerity in his attachment to his religion, but he had charity for all mankind. Like Fenelon, he only wished to do good, having no desire to accumulate wealth. His charities to the poor were great, and he assisted in every improvement of the city. That he was not ambitious was the opinion of all Bordeaux, for they said that he had refused to accept the office of tutor to the young Duke of Bordeaux, then heir-apparent to the throne. This was considered in France the highest honour that could be given to any subject—that of forming the mind of him who was to reign; it was, as they think, in some measure reigning himself: but this he had no desire to do. It could be plainly seen when we were there, that there was a gloom on the face of the good bishop, for he could not be ignorant of the state of the public mind in Paris, and some symptoms of a revolution appeared even in the loyal city of Bordeaux. In a few days after our departure the revolution broke out in Paris which hurled Charles X. from the throne, and called in a citizen king. In this change of affairs the bishop lost his peerage, as did all

others made by Charles ; but this was no cause of grief to the good man ; it gave him an opportunity to devote his whole time to his ecclesiastical duties. It would have been fortunate for the young duke if he had had such a guardian and instructor as Bishop Cheverus. If Charles X. had been instructed by a wise, prudent teacher of the nature and feelings of man, he would not have lost his crown.

France is a delightful country, and under a mild government would be a happy one. Everybody strives to be as happy as they can in France ; it is not always so with us ; among some of our people there is a disposition to look at things on the dark side. If we hear of the approach of a comet, it disturbs the peace of some who are not wanting in good sense in other things ; but the approach of a comet in France would only produce a pleasant sensation, and they would draw no unfavourable auguries from it, but only envy the scientific the pleasure they would find in watching its progress through the heavens. There is such ease in the manners of the French, so much of habitual politeness, and such a desire to make you happy, that one is unwilling to leave the society to be found almost anywhere in France. The agriculture of the country, it is said, is in a prosperous state ; there is a neatness about some of their fields and vineyards that is delightful to one accustomed to ruder culture. The cultivators of the soil own much more of it than the same class of people did before the revolution. It seemed to me almost impossible that this could be the people that only a few years ago—a few in the age of a nation—had suffered so much by revolutionary fury ; a people whose fathers, sons, and

brothers fell by the dagger of the assassin or under the bloody guillotine. There were no traces of misery now,—nothing to remind you that such scenes of horror had ever passed, except now and then the mark of a cannon-ball in some old house, and these ruins are not numerous. From reading all the agonizing details of the revolution, I expected to find many insane wretches, made so by these sufferings; but after all my inquiries—and I made them until they created a smile,—I could not find a single maniac whose madness could be traced to witnessing or sharing in these horrors. How soon a generation is forgotten!—even that great wonder of men, Napoleon, whose name was on every tongue from one end of the earth to the other, was now seldom mentioned in the city, or anywhere in France. What a lesson to those who seek fame through fields of devastation and blood!

In Bordeaux I found a file of American newspapers. It was true that they contained nothing new or interesting to most readers; but to me they were dear as the light that visited my eyes. There were the little squabbles of editors; the complaints of some neglected actors, the puffs required to vend patent medicines, or to call the attention to a sale of the last importation of bonnets or fans. All was delightful to me, for I knew that the interesting Mr. A—— was to preach in —— street, on a particular evening, and that the learned Dr. M—— would give a lecture on such an evening on political economy, or on steam-engines, or internal improvements, or on the raising of hemp, or the last public sale of domestic manufactures. This medley was delightful. I could rejoice at the hymeneal register, and drop a tear over the obituary notices. The exile

never kissed the ground on his return to his native land with more enthusiasm than I read these newspapers ; only some fifty days old. To me they seemed as thrown on the breakfast-table all wet from the press. I read all the advertisements, as delicious morsels of information ; not a word was omitted. The speeches of politicians at dinners given for their political services were read with attention, in truth devoured. It made not a cent's difference on which side they spoke, for they were my countrymen, and they had a right to differ among themselves ; nor was I sure I wished them to agree if they found more pleasure in disputing ? I felt no disposition to set them right if I could have had the power given me, for I did not know who was right, but thought them all so. The number of new publications I saw advertised was such that it seemed as if all that my countrymen had been doing while I was absent had been to cultivate their minds ; and I was happy to find that they had enjoyed themselves in this way. I expected to find every one so improved that I should hardly dare to see my old friends. I learned the "whereabouts" of all the state and general government politicians, and what they had been saying and doing in my absence.

I picked up a few American books in this city, of recent date, and these were greeted as old friends, and read with delight ; but I made no criticisms, for one long absent from home never complains of any thing from that quarter. I could wish that all who criticise their own people were obliged to wait before they commenced their review until they had got three or four thousand miles from home, and I really think we should have much

less vituperation. If any writer of distinction could see his works in distant countries, and know what ubiquity he possesses, he must be happy indeed if he is conscious that what he has written is not exceptionable on the score of principle. Irving, Cooper, Webster, and several of our poets are found at many places we visited; and those and other American names were familiar in Asia and Africa as well as in Europe. I must say, however, that English vessels are more likely to bring out recent literary and scientific productions than our own, but do not equal us in general in the extent of the useful library made up for the voyage. Hardly a single vessel thinks of putting to sea for a long voyage without taking several hundred volumes. Master mariners have found out that officers and men on a long voyage can do their duties, and have some time to improve their minds too. The selection is often not the best that might be made for this purpose, particularly of books relating to our own country, for there are but few who visit other countries that know much about our own. It would be doing a service, if some one acquainted with books were to make out a catalogue of such as should be collected for ordinary and for long voyages. All the approved naval journals and voyages are indispensable as guides for the purpose of obtaining the most information in the shortest time. Some good commercial dictionaries, and geographies, and gazetteers should be always at hand; and works of taste should not be forgotten. An interesting work appears with double charms on shipboard. The mind is then concentrated, and cannot be dissipated by amusements or trifles—it comes with all its force to a

subject. Not only a matter of taste but a moral lesson sinks deeper in the mind when there is nothing to distract our attention. The great mathematician of our country, who is considered greater in Europe than in America, gained most of his information during voyages at sea. His name and his commentaries on La Place's great mathematical work are familiar to all men of science in France. Dr. Bowditch performed many long voyages, as factor and master, from the United States to India; always having with him good officers, he had leisure to go through those long and difficult calculations which have laid the foundation of his great fame, so valuable and so dear to his country. Every person at sea is constantly reminded of him, as his Navigator is on every officer's table. This book, I believe, has taken the place of all others among our mariners, and is highly esteemed by navigators of other countries. It is said, also, that the numerous corrections made in tables by him were made at sea. I am surprised that tales or poetry are not often written at sea, for passengers surely have leisure when officers have no spare time. The inspiration is generally from the pure air, which, after all, is one of the best inspiring agents in nature. The dreams of Delphos were upon some divine afflatus, as the poets call it, which were probably nothing more than a sweet bracing wind.

I was delighted at the information I received here, that my countrymen were much respected in France, and that we were no longer considered an infant nation, but as one that bore a proud flag, that had reared and was rearing historians, poets, orators, and above all a class of profound statesmen to guide the vessel of state. I had not

thought much of these things when I left my native land, but now I was identified with all of them in some degree; certainly in feeling, if nothing more. I looked forward to the day when my own dear boy might be an active man among them, and the prospective view of that period, generally long to those who have children, did not seem to me at this moment half so long as I had been absent from my country and my child. Travellers, it is said, are mostly short lived, and I can easily conceive of the truth of the remark, for they suffer and enjoy so much that the human frame is exhausted by the various emotions of excitement—from anxiety, from gratifying news, and all the changes that agitate their hearts. In the midst of these emotions I thought I should sit down in my own chamber, and enjoy, oh! sweetly enjoy all my former domestic quiet; and yet I would not give up the memory of the things I have seen, suffered, and enjoyed, to be sure of the most protracted existence. Such contradictions we are, and such we shall always remain. The distance from home now was a mere trifle; only three thousand miles, and that the Atlantic, my own ocean, for it washed the shores of my native land, and I did not think that she would now be deceitful or unpropitious, since I had braved so many dangers in the Southern Pacific. When the anchor was weighed for our departure, and our kind friends came to take leave of me, I thought only of a pleasant sail, as on a party of pleasure. The countenances of the hardy seamen, inured to all climates, and at home in all countries, seemed to me to glow with the thoughts of their native land, and they sprang to their duties as if they had turned their faces homeward.

CHAPTER X.

Conchology—The Pearl-oyster—The Nautilus—The large Shell used for War Trumpets—The Eyestone—Character of Sailors—Causes of their Ignorance—Their Errors on the Side of Virtue—The Neglect of their Education—United States' Ship Vincennes—Manner in which Seamen should be treated—Character and Description of Sunday and Monday, two Natives brought Home in the Antarctic

ON the voyage to New-York from Bordeaux, I took an opportunity, in pleasant weather, to arrange the shells I had been collecting in the Southern Pacific. I was, when quite young, much pleased with the beauty of shells, and had received from sea-faring connexions a pretty collection. This taste I afterward gratified in gathering them on the beaches of the many islands at which we made a shorter or longer stay. My passion for conchology increased when I turned to writings on the subject, and found how long this branch of natural history had attracted the attention of mankind, and how much had been done towards classifying and describing the great variety of shells. I had considered them the mere playthings of taste, nor once dreamed that such philosophers as those of Greece had paid attention to picking up and describing shells; but I was happy to find that those things which gave me so much pleasure were really among matters of importance. More than two thousand years ago Aristotle made a treatise upon conchology for the benefit of his pupil

Alexander the Great. At first it seemed strange to me that he who was deep in the mysteries of logic could stoop to examine the shell of a muscle, or that he who was grasping at universal empire could listen to a discourse on shells; but I believe the more intelligent the age and nation are, the more these minute subjects are attended to, for during all the night of darkness when the world was overrun with superstition, no attention was paid to natural history. Those who were discussing absurd questions in theology were likely to neglect the works of God as displayed in his creation and providence. A little more than half a century since, the science of conchology was revived and enlarged, and is now in a train to become extensively understood. The admirable construction of shells for the purposes for which they were intended, and the beautifully variegated colours with which many of them are adorned, afford additional proof to the observer of nature of the superintending hand of Providence extended even to the minutest objects of creation.

It is a beautiful sight to look along the shores of some of the islands near the equator and mark the endless variety of shells thrown up by the winds and waves—the houses of tenants long since dead; but if we could rake the bottom of the sea near those islands and find the living shells, they would be much more beautiful. The shells the divers brought us with the inhabitant alive were in beauty of tints far more exquisite than those bleached by the sun and rains, and washed by ten thousand tides.

The pearl-oyster, as the conch is called, which contains the pearl, is worthy of examination.

This oyster is about three or four times as large as the common oyster, and, as far as I could learn, a being of higher faculties; he has the power of locomotion, and moves, if at no great distance, or with any considerable speed, backward and forward to find his food. The shell is sometimes called mother-of-pearl; an expressive term, even if no pearls are found within the shell. The pearl was long supposed to be fixed to the shell, to assist in opening it, or for some other purpose,—Heaven only knows what; the pearl, however, is not found adhering to the shell, but grows under the most fleshy parts of the oyster, or near his head, leaving a mark upon the shell. This creation, like that of the ambergris, has never been satisfactorily accounted for, and perhaps never will be. The great Author of nature intended, no doubt, that the beings he had endowed with reason should have perpetual enigmas to solve, so that they might be satisfied that they could never reach him by attempting to fathom all the secrets of nature; for he knows their ambition and their pride. The natives of the South Sea islands make these shells useful in the formation of instruments, such as hatchets, spears, fish-hooks, and knives; and, if not equal to iron and steel, they are vastly superior to those which could be made of silver or gold. It is not a little singular to one living constantly on land that the ancients should have attributed to the sea so many of the loveliest of their mythological creations; Venus rose from the foam of the ocean, and the Tritons sounded their shells at her birth. These fictions were unquestionably of Indian origin, for there the ocean is most lovely, and the shells the most beautiful. The Greeks got their descriptions second-

handed; for the shores of the Mediterranean or those of the Red Sea produce no specimens of conchology to be compared with those of the islands near the equator.

I had read that Cleopatra dissolved a most valuable pearl in vinegar, and drank it. The vinegar must have been stronger than that which we had, for I tried one of the almost imperceptible pearls, taken by thousands from these oysters, and could not dissolve it in a whole day. She, I think, must have mixed a little water with whatever could dissolve a pearl, or have had a royal stomach indeed. The ancients must have far exceeded the moderns in knowledge, or the wonders of early history must have been described with little regard to truth. If Egypt's queen did not drink the pearl, she taught her subjects how to find it. After her restoration by Cæsar to the throne of the Ptolemies, she pursued the commerce of her ancestors, and grew wealthy beyond all the Eastern monarchs of her age. Antony bestowed upon her Phenicia, Cyprus, some part of Arabia, Crete, and other commercial places. Her reign is a proof of the intimate connexion of letters with commerce.

It would require a huge volume to give any satisfactory account of even the small number of shells we collected, compared with the myriads on the shores of the islands in the Southern Pacific. The nautilus, of which we gathered a great variety, is quite a curiosity, and has held a high rank in conchology for many reasons. It is a vessel, and some of the ancient poets, and modern ones too, make it the prototype of vessels and of sailing. The various species of the genus are found in most warm countries; they

are of all sizes, from that of your thumb-nail to upwards of eighteen inches from stem to stern,—as the sailors speak of them while sailing along. The living and fleshy part of the nautilus does not weigh much more than an ounce, whereas the shell would hold a quart; but this living part has the power of throwing all the water from the shell, and of sailing by projecting a membrane, which the sailors in their significant manner call a stern-sheet. The outside of the shell is white and smooth, and the inside is of a pearly cast. The natives make these their drinking-cups when polished and ornamented for use. These ornaments are often singular; I have several of them bearing fancy sketches decidedly superior to such as often appear in Ackerman's Repository, for ladies' ornamental work, and the *La Belle Assemblée*, as patterns for the working of fashionable handkerchiefs or vandikes. And I believe some of the queens and princesses of these isles can arrange and wear a tuft of feathers quite as tastefully as any lady at Almack's at a fashionable ball. These shells are not used for any purpose that I know of among us, but they are certainly as handsome as any large shells we have in our cabinets.

The large shell generally called by the common name of conch is found in these islands in great abundance. These shells are artificially perforated near the top, and are used as the war-trumpet by the natives. They never sound it except as a general signal for muster. The power of it is vastly greater than that of the trumpet, and may be heard farther than any martial instrument in use among civilized men. There is

something extremely natural in all the seemingly monstrous fables of the ancients; they made the Triton blow this shell as trumpeter to Neptune, even as far back as Deucalion's flood; and at the sound the waters retired. The sound of this shell can be heard for many miles when blown by a strong-breathed sailor in the mood of amusing himself, without having any classical images in his head. The conch was brought to some parts of our country very early; in fact, I have been informed that some of the original settlers introduced them when they first came here, and used them to call the distant workmen to their meals. History informs us that the Indians in the wars of King Philip were at one time frightened from their purpose by some accidental sound of the dinner-summoning conch; and at a much later period, it was used in the interior of our country to call the inmates of a college to dinner or to prayers. The ancients considered these shells as carrying within them a spirit of echo, and whoever puts one of them to his ear will discover from whence that impression arose. There is a sound of distant waters in his ear; the lashing of the billows upon the beach. What close observers must have been these poetical examiners of nature: and we might add, how many of these impressions remain on the minds of the present generation. Perhaps many of our commonly received notions would not stand the test of modern criticism in an age when nature is so severely scrutinized by philosophers.

There is another little shell, commonly called the eyestone, of which I have seen no satisfactory account, though I do not mean to insinuate

that there is none extant. I do not know the classical term for it, and therefore must speak of it by its popular name. The former impression that we had upon this subject was, that the eyestone was gifted with life, which slept in quiet until man wanted its services, when by plunging it into vinegar it was revived and ready for use. When by some misfortune a moat gets into our eye, the sleeping agent is roused to fitness for use by a powerful acid. That the eyestone discovered such signs of life as to make it susceptible of motion in this acid no one will have the hardihood to deny, for most have seen and can bear testimony to it; and how natural the idea that vitality is connected with motion. The science of the present day, however, is not content to receive any thing on trust; and the notion of the vitality of the eyestone, in common with other popular errors, is now exploded. A few lessons from our old friend Dr. Griscom, I think, would enable any one to conjecture that this stone is an alkali, and the acid being poured upon it gives it action and effervescence, which accounts for its motion round the vessel into which it is placed with the vinegar. Put into the eye, it moves around under the lid by the natural action of the parts with which it comes in contact, and being so smooth—for all its excrescences are destroyed by the acid—it gives no pain; and working under the lid, often pushes before it any speck or moat, and relieves the eye in a short time. While it is in the eye we forbear to rub the lid for fear that the stone will get out of its place; of course the eye has a rest which in ordinary occasions of its smarting we should not be disposed to grant it.

Many of the phenomena of nature were known to the ancients only by their effects, and it was left to modern science to trace their origin to natural causes. The knowledge of the ancients, being confined almost wholly to the priesthood, offered a ready instrument in their hands to govern the minds of men by superstitious terrors. The light of science, however, is no longer confined to the pagan temple or monkish cloister, and gradually develops in their natural forms many things which superstition and ignorance could only attribute to the supernatural.

I have been astonished that an attempt to reform seamen should have been left to so late a period as it has been. A current opinion has been afloat ever since commerce was introduced into the world, that those who went down to the sea in ships should be rough, bold, and uncivil; and it has been left for moderns to discover that these characteristics are not necessary to make a good sailor. That they should be bold and fearless necessarily arises from their duties, their exposures, and their vicissitudes; cowardice in them would lead to destruction, and they know it. Habit makes them often do an act the consequences of which they do not stop to calculate; they are hardy, generally, from exercise and sea air, enjoy health and strength, and seldom grow indolent from indulging in too much sleep. Profanity is with them rather a degrading habit than a blasphemous feeling or disposition: the officers too often indulge in the vice, and the sailors imitate them. They are superstitious because they are ignorant; constantly seeing remarkable things without being able, by any knowledge they have, of accounting for them, they have re-

course to their imaginations for causes, and this power of their minds is without cultivation or taste, and the greater the mystery the better ; but still their hearts seem to be right.

Nineteen-twentieths of the sailors who double the Cape of Good Hope and go into the Eastern seas believe in the truth of the Flying Dutchman ; they have well-authenticated stories of honest seamen, who bore honest testimony to the fact ; and if it was the only way to establish the truth of a matter by the solemn testimony of witnesses, this would be as well supported as any event in history. Cotton Mather speaks of a phantom-ship which appeared near the harbour of Boston. A vessel had long been missing, and the friends of those on board her became distressed ; prayers were offered up for their safety, but when she was quite given over, a ship was distinctly seen by the people of Boston coming in under full sail. So distinctly was she seen, that men were visible on her decks ; she came on swimmingly for an hour or two, when in an instant she vanished, and was never heard of or seen any more. It was considered by that pious and learned man, and of course by most others, that this was a kind vision from the Almighty to assure all those interested in the fate of the ship that she was lost, and all hands perished. Those who did not believe in this interference of Providence to shadow out such an event, did not know how to account for the phenomenon, and of course were silent upon it. For nearly two centuries this story was told, to the belief of many, and to the amusement of others, when an explanation was given by a similar appearance in the city of New-York. In the fall of 1826, the appearance of

several vessels was seen from the Battery upon the horizon, clearly and distinctly, when the ships whose images were reflected were not within sight. These images, by refraction, were thrown on a cloud beyond them by the rays of the sun; and while many wondered the philosophers explained, and a satisfactory solution of Cotton Mather's story was made out. Some ship from the north was sailing towards the south, and not wishing to enter the port of Boston, was so situated as to be reflected on such a cloud; and hence arose the appearance which was proved beyond a doubt, yet was not believed by the reasoning people of subsequent times.

There can be no doubt of the fact that in these seas where the phenomenon of the Flying Dutchman has been again and again seen, that this effect is reducible to the same cause. The sailors have a tradition that this Flying Dutchman and his crew were wicked enough to deny the Christian religion, and to trample the cross under their feet for gain, with imprecations upon their heads if they did not despise it; such as a wish that if they were not sincere in their renunciation, they might never return again to their native land. For this unpardonable sin, this vessel and its crew were doomed to fly from place to place until the world should be destroyed. This very prejudice, however, was on the side of virtue, and has been made use of to keep seamen from denying their faith, even in the midst of their blasphemy; and although it is known that the Mohammedans make strenuous efforts to induce a Christian to profess their faith, yet but few even of the most profligate of the sailors of Christian nations have been known to change

their religion, even when the temptations held out were of the most captivating kind.

The sailor is generous, bold, and faithful, with even prejudices that are on the side of virtue; why, then, is he left in ignorance, and hardly reckoned a part of the intellectual or moral world? It has not been his fault half so much as the fault of those who had the control of him. Those who employed him, and could not do without his services, reasoned like the despot:—“My authority is at an end when they know any thing more than mere seamanship; if they could navigate as well as I can, they would take my ship and go where they please with her.” This reasoning might be true if they were to be instructed in science without any attention to morals. This subject has now become of importance to our country, considering the great number of sailors we have. Taking the navy, and those engaged in foreign and domestic commerce and the fisheries, there cannot be less than sixty thousand; forty-three thousand of these are employed in commerce, and ten thousand in the navy. Instruction might be given to all these at an easy and cheap rate, and they might be made more respectable citizens without injuring them as sailors. Merchants often say, if you enlighten these men, who are now only so many good machines to work or fight a ship, and make them understand their situation, you raise at once the price of wages, and commerce will not afford this. But can they not at the same time see that this could not be an evil of long continuance, for the wages are always incorporated with other expenses on a cargo, and the consumer, not the merchant, pays for it. But is the objection true? Would not the

regularity of the conduct of seamen lessen insurance, and produce more despatch in voyages, and by these means make a balance in favour of the merchant in the end? If sailors were properly educated and kept sober, there would be less chance of their turning pirates, and of committing crimes at which all mankind shudder; and which are now becoming so prevalent that scarcely a paper is issued without some mention of the loss of lives and property by piracy. Humanity is appalled at some of these atrocities; the naval force is called upon to avenge the injuries: but this moral discipline would do better,—it would, in most instances, prevent them.

It is not a little extraordinary that all nations should so far forget themselves as to have no system of instruction or discipline for sailors, except such as is left by law in the discretion of masters of vessels. There is in the world at least a million of seamen, who are engaged in fighting their country's battles, or assisting in the sailing of vessels of merchandise, or in the several fisheries, and hardly a school among them all. No farmer hires a man who is not recommended to him as an able-bodied man, and one well acquainted with his duties; yet a merchant waits, after he has fixed upon his voyage, selected his master, and got his vessel loaded and just fit for sea, and then drums up his crew on short notice, only inquiring if they be good seamen, without thinking of their moral characters at all, or making the slightest inquiry whether the man they ship is a pirate or an honest seaman. As long as this is the case, and there are so many bad men who resort to the seas, perhaps to escape the punishment due to their crimes, no wonder that

so many deeds of horror are perpetrated. Inquiry should be made into every man's character before he ships, and then proper arrangements made to treat him well on the voyage as to food and instruction. I believe this good work has been begun in many of the seaport towns in this country. Provision has been made for mariners' churches, and with no doubt some fanaticism, much good has been done in many respects. In the navy there are now some chaplains who can both preach and pray. I would not have a ship a conventicle; but much may be done without any cant or overstrained piety. Get such men thinking right, and you will soon find them acting well. Thus educated, instead of sowing the seeds of profligacy wherever they went, we should find them seeking to do good; and opportunities often occurring, much might be effected by them in all parts of the world. Those with whom these men are connected on shore would be benefited by their example, and they would not only do good abroad, but in time the wave of their exertions would be *rolled* back to bless the land of their birth and the home of their affections. Educate sailors, and they would contract binding ties, which is not often the case now. We are, and ever shall be, a great commercial people; of course a navy will be constantly kept up; and is it not of vital importance that we should set about a school for reform?

Just before we arrived at Manilla, the United States' sloop-of-war Vincennes visited the place. She was, in all respects, a fine ship; the people of Manilla spoke of her neatness, her order, and the decorum of her crew. There was no revelling in her, nor by her crew out of her; the control over

them was perfect. This was owing to the honourable agreement between the captain and the chaplain; they understood each other, and the crew understood both. All things were put in order by concert at head-quarters, and of course carried into effect; both officers were men of sense, and expected no more than could be performed by men; but they took every efficient measure to bring the minds of the crew to a just sense of reasoning; and instruction was going on while duty was performed. This was as it should be; and no ship ever yet went round the world with so much ease, with so little loss of human life, and with so much harmony, as the Vincennes. It was only an ordinary voyage to them, but extraordinary, in fact, to every looker-on. The discipline of the crew was a source of wonder to the people of every place they visited. This is only a sample of what may be done: the allowance of whiskey should be cut off by fair contract, and something substituted in its place. Government should not save by any of these regulations, but should rather over than under-pay; let good and wholesome meals be always provided, and good and wholesome instruction be constantly going on, and the seamen would be content, and the ship for ever secure. It has always been found that the true Christian will fight like a lion; it has never been found that principle has destroyed mental energy, but, on the contrary, has sustained it through every contest. Change the moral character of your seamen, and you make them invincible; let the modes of instruction be simple and easy, not made as a task, but granted as a boon, and all will be right. It is my belief that a crew of men formed on these principles, and so

trained and treated, would not flinch from twice their number of such as are commonly found in what has been emphatically called "the floating hells of the sea." I am not one of those fanatics who think that all the world are to be made Christians and devotees at once, and that all duty is to be absorbed in the forms of religion. No; but from what I have seen, I believe that every ship's crew can be made a well-regulated family, in which decency and decorum may be found as well as on shore. That vice can be rooted out of the world entirely I am not so weak as to suppose; but I do believe that where law is so supported by principle, sailors can be made as good men as others, and governed as easily. If there was ever any meaning in the oft-repeated declaration of the good Bishop of Cloyne, that

"Westward the star of empire takes its way,"

it was to rise in some moral, not natural relation. If man is here to rise to higher eminence as an intelligent being than he ever did in the old world, it is not from his capability of destroying, but from a disposition to benefit his species,—still to protect himself. Man is mentally and corporally enfeebled by vice, and his energies and exploits are immediately connected with his health and his sanity of mind. The phrensy of inebriation may last for a few moments, but the calm determination of honest feelings and clear views is worth much more than all the fury of accidental excitement. I know that there are honest men who think these reasonings a species of fanaticism, and I do not doubt that some things said at the Bethels and mariners'

churches may savour of fanaticism; but that is no argument against the attempts to make sailors rational, and moral, and religious beings; it never was, and never will be the case, that a reform was conducted in all respects by the cool dictates of the understanding.

I would commence systematically. In the first place, I would introduce a few well-written epitomes of moral and religious duties, with some interesting anecdotes of Christian mariners. They should be without sectarianism, or any thing that had a bearing that way; and, in addition, a fair epitome of the best voyages now extant should be made up for the use of the crew. Every thing should be fairly used to make the profession appear in its true and honourable light, without colouring or deceit; every sailor should learn, as by this mirror, to see and respect himself. By small treatises, he should be taught his duties in every way. If his duties as a seaman were clearly laid down, he would learn them in half the time he now does by curses and floggings. He should then be carried to higher views of science and navigation, and should consider himself an intelligent being, engaged in an honest cause, and for a proper end. This may seem chimerical to one who has several ships, and wishes to get them navigated as cheap as possible; but the calculations and arguments of any one should yield to general interest and common understanding. When there were but three or four banks in the United States, the stockholders, it is said, objected to having any more, as the mysteries of managing them were above the ordinary comprehension. The mystery of managing the moral and temporal con-

dition of sailors may be thought to be above the comprehension of a woman ; but, however, one thing is certain, that if my remarks are of no service, they are at least harmless. To ship a sailor, learn him to do his duty, and to bring him back safe after he has honestly and honourably discharged his duty, has no mystery in it, but a good deal of common sense.

Our manufacturing establishments, it is said, will be exempt from many of the evils which are found in those of Europe, because in most of them provision is made that the young of both sexes shall not grow up in ignorance ; and why should not this principle be incorporated into our commercial establishments ? Merchants have made and are making ample provision to preserve the morals and to enlighten the minds of their clerks, to prevent fraud and peculation ; and why should not equal attention be paid to the moral and intellectual improvement of mariners ? To them, in fact, as much is intrusted, without the same ready means to bring them to a sense of justice. Provision should be made to instruct sailors when out of employment. A plan has lately been suggested by a patriotic and intelligent member of Congress to make the whole army of the United States one great seminary of instruction, and to dismiss all its idle and good-for-nothing drones, and introduce youthful ambition in their place. The plan, I verily believe, will succeed when it is properly understood, the army will be made much more efficient than it now is, and thousands of good citizens will be added to the republic. If the contemplated improvements in the condition of soldiers cannot all be realized with respect to seamen, still an

approximation can be made, and the sailor, should he be disabled or disinclined to follow his profession, may be enabled to fill some station in society for which he is fitted : but according to the present system, when a sailor can no longer discharge his duties on ship-board, he is considered as an outcast from society, and must expire in some asylum of charity, or die by excited intemperance. This is wrong ; the moralists and philanthropists of the age should set about devising some remedy for these evils, and the sooner they engage in it the better.

I had almost forgotten to state that while visiting those islands near the equator where we had some skirmishes with the natives, we took a prisoner, whom, from the day on which he was taken, we called MONDAY. He was picked up from the water : the canoe in which he was being destroyed by the cannon-shot, he took to the water, and being wounded, was taken in by our boat's crew sent for that purpose. He is apparently about twenty-two years of age, five feet eight inches high, stout made, and quick in his movements. He is rather sullen in his temper, but has never appeared vindictive to us. He is ingenious, and very imitative. At first he seemed to wish to remain in ignorance, but after a while came to a better disposition, and was desirous, in some measure, to oblige. His countenance is that of a savage in every respect : he has the Indian high cheek-bones and the dark humours of the eye. He is not of a strong constitution, seeming rather inclined to consumption : but how any being could have that complaint who was born and lived in the climate he did I cannot tell. Perhaps the thoughts of being a prisoner preyed

on his mind, and the sickness of his heart was taken for that of another kind. At times this savage would sit and look steadfastly upon the ocean towards, as he probably thought, the point from whence he came, for whole hours together. Every kindness was shown him ; he ate what he pleased, and when, and not a blow was ever given him by any one ; the sailors having strict orders not to disturb him nor his companion. He wandered about the deck, and showed at length some marks of interest in things around him. He soon became familiar to clothes, and fond of them.

SUNDAY was a native of more importance ; from another island, taken shortly before Monday. He is a stout, well-made man, of five feet eleven inches in height, weighs about two hundred pounds, and is remarkably strong and active. He is without doubt a chief among his tribe, for he led the attack upon us, and bore himself bravely. His corporeal strength is wonderful ; no one on board our vessel possessed equal muscular power. He is supposed to be about thirty-five years of age, and is very tractable. He soon learned many English words, and seemed anxious to know as much as he could. He is very good-natured, docile, and obliging ; and understands sufficient of our language to know that he has a promise from my husband that he shall return to his native land as soon as circumstances will permit. He has more of the African cast of features than the inhabitants of most of the islands we visited. He states that he had three wives, to which number his rank entitled him, being the son of the king of the group, who was an old man, and did not come out to battle. This is probable, for we never perceived the slightest disposition in him

to utter a falsehood. He seems to be open, generous, and willing to do any thing he can for others; he is extremely anxious to return to his native island, and promises to make them all do right.

I am far from the opinion that these people whom we call savages have the worst dispositions of any people on earth; on the contrary, I believe that if their hearts could first be reached by kindness, they could easily be brought to observe the rules and decencies of society. I state this for the encouragement of those who may hereafter become missionaries to these benighted parts of the earth. This very savage may, and I trust will, be an efficient instrument in opening a way for the labours of pious men who may be sent into these regions. Besides the good it will do, will it not be a source of happiness to those engaged in such a cause? Is there not a disposition in every enterprising mind to erect some memorial of his exertions which will endure beyond the time he may live? Do not these almost unknown regions afford an opportunity for virtuous distinction? To carry civilization and Christianity to such remote parts of the earth would have given joy to the apostles themselves; and is it not a happy reflection to the zealous good man, that there is still a wide field for him and his successors? I never saw happier beings than the missionaries in the island of New-Zealand, although so far from friends and country, and the good of savage men their only reward. I have often thought of the sincerity of these people, who were not among the poor and destitute in their own country, but possessed of means to live and bear a respectable part in society. They labour from one year to another, with all the care of those who have the cure

of souls, in truth and reality thinking of no recompense this side of heaven. How sincere the religion—how warm the faith, that can support them in all this! It is almost equal to that expressed by St. Paul, who could wish himself condemned for Christ's sake. The spirit and zeal of him of Tarsus is abroad, united with something of the sweet affections of him whom Christ loved; at least I thought so when I visited New-Zealand. I loved them for staying there, but I should not have dared to ask my heart if I could join them; I should have feared a worldly answer from myself, but, thank Heaven, I can never be put to the test.

CHAPTER XI.

Observations on the Progress of Discovery—Remarks on the Marine of various Nations—Aurora Borealis—Anecdote of its Appearance early in the last Century.

THE glories of discovery are divided among the maritime nations of Europe with our own country. Those that were once famous on the ocean are not so now. Those who sailed from the Gulf of Finland, and spread terror through Europe, are not now known as having any navy, or vessels of commerce. The Portuguese are seldom found at this day in their own discovered countries; and the Spaniards are hardly known in the countries over which the nation still holds sway. I do not know that either of these nations have, for many years, had a ship of discovery on the seas, on which they once were the masters and lords of every wave, and but very few pursuing the regular course of commerce. To a Spaniard who calls to mind the rank which his country once held among the nations, when the Indies and the greater part of Europe acknowledged her supremacy, it must be a melancholy reflection, that empire has passed or is passing away from her. The galleons which once sailed from Manilla to South America, and to Spain, are now only reminiscences of history; no such thing is seen in these seas, and it requires some degree of faith to believe they ever existed. If the

Spanish ships are scarce, the Portuguese are scarcer; a vessel may sail the globe without meeting one of either nation. The Prussians and Austrians never put in any claim for the honour of discovery: and Denmark and Sweden can boast of but little more for these three centuries past. Venice, and Genoa, and Florence are now as if they had never been, in a commercial point of view. Most of the nations who once contended for fame as discoverers, do so no more. The only flags now to be met with are those of England, France, Russia, the United States, and now and then one of the kingdom of the Netherlands. The commerce of Holland is reviving—she has long been in the background, but is certainly rising in enterprise and power. The autocrat of all the Russias has evinced a desire that his empire should be ranked among the commercial and naval nations of the world, and has been at some expense to support this assumption. If his share in the bloody battle of Navarino has done him no honour, the voyage of Von Kotzebue has. Russia has too deep an interest in the Western Pacific not to have a respectable force on the North-west Coast. Russia is slowly, but surely, extending her commerce and maritime power over every sea, and will make her way if she pursues her present policy. France has not extended her empire much since the battles of the Nile and Trafalgar, but is increasing her marine with no humble objects in view. Her navy now falls but little short in point of numbers to that of Great Britain, and her colonies are next to the British in fertility and commerce. France has always in modern times, of which we are speaking, been ambitious to have

her share in exploring and in governing the world. She may be said to watch every point of inspection along the deep ; but since her disasters in the great battles with England, with less than her former display, yet, I have no doubt, with all her former sagacity. The discoveries of England are made public by government at once ; but the French discoveries are only partially given to the world ; since the days of La Perouse, they have not published any thing of consequence. If France is suffered to remain in peace, we may rely upon it she will have no humble views of her knowledge and her power. Her ambition was always great, and as she has gained in intelligence, she has lost nothing of her pride or her enterprise.

Although there is no parade made about it, we find French ships everywhere. They pursue their course in silent duty, but not without gaining information. England, it is true, considers the ocean as her own, and sails it as if this superiority was never to be disputed. The imposing appearance of her ships was well calculated to impress the minds of the people in every distant region they visited with an idea of the power and importance of the empire, especially when contrasted with the smaller size and inferior equipment of those of other European nations. The natives possessed no other means of judging of the relative importance of the countries which traded with them ; and it is to be presumed that no endeavour was spared by those who navigated the British vessels to increase this favourable impression. From this cause it has arisen that every expression of admiration and reverence that these aborigines have

at command has been exhausted on the British navy. This influence is fairly earned, however inimical it may be to the views of nations at this day, when all are strenuously contending for their rights. I know not how they can remedy the evil which is experienced by the superiority of England, except by emulating that country in their commercial exertions in every part of the world. The United States, if her commerce and marine increase as they have done for twenty years past, will be nearly, in twenty years to come, as much interested in the trade of the southern hemisphere as England. The visits of our vessels of war to the remote parts of the Western and Eastern Pacific have had a good effect on the minds of the Indians, Malays, and Chinese, who think nothing of justice, but only as it may be enforced by power. Some civilized nations must in time be masters of these remote islands, and it would be well for us to have a share in the influence that may be exercised in this new world abounding in articles of commerce. Settlements on some of the numerous islands lately discovered by American navigators would be acceptable to the whaling ships as well as to other vessels, and would create a new market for many of our articles of commerce. The field is as wide for the philanthropist as for the merchant, and he would be as eager to occupy it.

The maritime power of Russia is one of those that will increase, if not rapidly, yet surely. The spirit of Peter the Great is in existence in that government, and will not easily be driven out of it; he said, in the pride of valour, "Nature has but one Russia, and it shall have no rival." At that time he hardly knew that an empire had been planted in this western world, which

now bids fair to share the honours of national influence with Russia. The opening of the Euxine will give Russia facilities for commerce and for increasing her navy, which she has never before possessed, and there can be no question but that she will avail herself of every advantage she gains.

The naval character of the people of the United States may be said almost to be incorporated with, and form a part of their nature. Our forefathers began to navigate the ocean almost as soon as they had landed on these shores: more than a hundred years since, the colonies had a spirited little navy, that carried the provisions and troops in 1717 to Canada. In the war of 1745 the naval power of the country was respectable if not formidable. Vessels of considerable size were sent by the colonies to the siege of Louisburg. In the war of 1755, and onward to 1763, American sailors were distinguished for enterprise and bravery. In that of 1775 the colonies astonished the English by the number and spirit of their private armed vessels, and the Congress in 1776 created a considerable marine, which was on the ocean in a very short time. The national and private armed ships, if our histories of that age be correct, took from the enemy fifteen hundred vessels. The history of that proud age has not as yet been fully written; there are many heroes as yet to be celebrated by our biographers. I may be thought enthusiastic in all this, but the achievements of those who won for us the high station and proud name we boast, I confess, have taken deep hold of my mind, and I will make no more apology for talking about them. In 1798 the nation was awakened by the insult offered our flag by France;

and a navy, a small, but spirited one, was instantly built, and commissioned to defend our commerce. Now it was that our country began to count the cost and realize the value of a navy. The orders under which our fleet sailed at first were so restricted, that not much was done excepting by way of protection; but when these orders were enlarged they captured many vessels, nearly a hundred, and recaptured many which the French cruisers had taken from the citizens of the United States. In this short war there were some fine specimens of naval character developed by our gallant officers. Captains Truxton, Little, and Shaw, and others, gained an imperishable name by their bravery and skill. Our people had hoped that the little navy would be cherished; but the policy of that day was against it, and all our ships were sold but a few frigates. This sacrifice in the end was of no importance, although a subject of great mortification to the merchants and the friends of the navy; but the glory it had won was secured, whatever became of the vessels. We had satisfied ourselves that man had not degenerated in our country, that his muscle and nerve were as good as those of any other nation. The parsimonious were satisfied that we could build and maintain a navy at as little cost as any other nation; and the timid began to think that we could fight in a good cause. Still our mother country regarded our power on the ocean as insignificant. They had fought France so easily, that they thought no honour was acquired by contending with them on equal terms. The fates were determined we should have no chance to grow rusty in our naval experience. All the piratical powers, whose rob-

beries and extortions had been borne so long by the nations of Europe, expected that the commerce of the new and feeble nation, as they thought us, would become an easy prey. The state of the times made it necessary for us, as a nation, to tamely purchase peace and immunity from Morocco and Algiers. This was galling to a free people, but policy required that we should suffer in silence; still we were not prepared to bear the yoke for ever. In 1800 the ship commissioned to carry tribute to the Dey of Algiers was sent by this savage on a mission to his master, the Grand Seignor at Constantinople. This indignity was submitted to in order to exempt our mariners from being taken as slaves, and suffering indignities worse than death. These pirates had long been the scourge of nations; for a thousand years they had held a piratical sway from the pillars of Hercules all along the shores of the Mediterranean. To their everlasting disgrace, Spain, Portugal, France, and England, with Denmark and Sweden, paid them tribute. At times some of the Christian nations had attempted to subdue these hordes of barbarians, and made great efforts for the purpose, but without success. In 1800, when the Bashaw of Tripoli demanded tribute of us in the most insulting manner, the people of the United States called aloud to have these freebooters and assassins punished. The Bey of Tunis raised his voice for tribute, and with the full belief that his exactions would be complied with. The Bashaw of Tripoli declared war with the United States, thinking to strike terror into the New World. Soon after this declaration of war, one of our oldest naval commanders was sent out with a squadron of observation, consisting of

three frigates and a schooner. His instructions were full of caution, he was not to fight if he could help it ; but this could not be avoided. On the 6th of August, 1801, Lieutenant Stewart in the *Enterprise*, of only 12 guns, took a Tripolitan ship of war, the first that ever was subdued by our prowess. The barbarian had more guns than the *Enterprise*. She had twenty killed, and thirty wounded in the action ; but there was not one American injured. Our naval tactics were now acknowledged to be of the first order.

In the spring of 1802 a squadron was sent out under the command of Captain R. V. Morris, who, being charged with want of energy, was superseded by Preble. It is said, however, that Morris showed no want of courage, but acted, as he thought, according to his instructions. Never was there a better commander than Preble. He was accompanied by Bainbridge, Decatur, Charles Morris, MacDonough, and others, since been made conspicuous by their deeds. The squadron blockaded Tripoli, and watched the movements of Algiers, Morocco, and Tunis, which, like tigers, were ready to start from their repose on their prey. The emperor of Morocco came to terms, and the Dey of Algiers was quiet, when Preble determined to chastise Tripoli with the force he had with him, consisting of a few Neapolitan gun-boats, which were but little better than so many mud-scows. On the 3d of August, 1804, the American commander made the first attack. This was appalling to the barbarian, and he lessened his demands of tribute and ransom ; but his terms were not admissible, and another attack was made on the 5th. On the 28th, Commodore Preble attacked them again, as

also on the 3d of September. Preble was now superseded, and left the Mediterranean. Peace was concluded the next summer between Tripoli and the United States on equitable terms.

This event astounded all Europe ; that a new power, of no note or name, should have carried on a war with such slight means, and to so glorious a termination, was indeed surprising. The nations of Europe could hardly be convinced of the fact that the thing should have been attempted, but to find it achieved surpassed all wonder. His holiness believed it a miracle in favour of the Christian church, and said almost as much in his communications upon the subject ; and it was indeed bordering on the miraculous, that a few ships of an infant country should instantly effect what powerful nations had attempted unsuccessfully for ages. The story was carried even to the harem of the sultan, and he stared at the account of our prowess. The wretches released from slavery sent the cry of joy abroad, and it was echoed by their friends throughout the world. Venice, Genoa, Naples, Portugal, Spain, and other powers had been foiled in their attempts on the smallest of these Barbary powers ; but we had taught them civilization in a short time. The corsair who formerly had sailed with the utmost insolence in these seas now fled from the first appearance of an American sloop-of-war, as if it were a vessel of the largest class. Their modes of warfare had been considered as most terrible ; but Preble taught the world that they were not so formidable, and might be attacked by any enterprising foe. This war was one which not only showed the falsity of the general estimate of barbarian power, but also of the power of civilized

nations in comparison with them. These pirates were more terrific than powerful.

From this war to that of 1812, our navy was not much increased, nor extensively employed. Many were apprehensive that its character would be lost in peace; and already many statesmen began to think that the United States could do without a navy. The officers of the navy knew that they had to fight themselves into fame, and to conquer the prejudices of the world.

A new field of glory offered itself to our brave mariners, in the war of 1812; and by them it was most nobly improved. Hull opened the scene with great gallantry and success; he was followed up by Jones, Lawrence, Perry, Chauncey, Stewart, Decatur, Blakeley, and by so many others who won fame by bravery and intelligence, that it is almost invidious to mention names. These brave men have already been honoured by the American people, and will be mentioned in history; and their fame will help to increase the public favour towards a navy. It is said that we have fifty vessels of war, nearly half of which are in commission. The whole are supported by less than three millions of dollars annually: so that for this proud defence the population is not taxed to the amount of twenty-five cents a head yearly. The French, which is supported at less cost than any other European navy, requires an expenditure four times as great as ours, and the British nine times as much. To keep the peace of the world at the present time, there are about 550 vessels of war in commission. Our force in the different seas is about a twentieth part of this power, and yet we have a much larger proportion of the commerce,

of the world to protect than this amounts to. But why all these calculations? say my fair readers. I answer, that I have been for nearly two years almost constantly on the high seas, have reflected much upon this subject, and have some confidence in my own view of it.

It is pleasant to pass from these calculations to contemplate the phenomena of nature, which are for ever giving us variety and food for thought. One evening, on my homeward voyage, I was called by my brother, who was devoted to my happiness, to witness a brilliant aurora borealis. I had hoped in the southern latitudes to have seen an aurora australis; but perhaps we had not sailed sufficiently south for a fair sight of this phenomenon; but a northern light was now illumining the heavens. It was not a novelty, for I had been often called by my friends to observe its occurrence while a school-girl; but it now appeared to me as something strange, probably because I had a better habit of observation. The sun had been down about an hour, when a dark cloud fringed the horizon, two or three degrees above it: this cloud was edged with white, sometimes changing to a brilliant fire colour: then arrows of light would dart from the cloud, and stream high in the heavens. Then the clouds would be seen above the light, and new lights would rise on the second band of darkness, converging to a point almost over our heads. The shapes of light were constantly changing: now resembling a volcano, and then pyramids, or burning cities, as the imagination fixed a resemblance on the forms of the instant, and it was only an instant that they remained the same. Sometimes the

fire would be seen streaming up on the left, and sometimes on the right. The sun, moon, volcanoes, electricity, and other causes, are said to produce this illumination of the heavens; whether it is caused by one or all I know not, and perhaps it is not of any great importance to know, only as a gratification to the inquiring mind. This phenomenon was first seen in North America in 1719, on the 17th of December; but the causes which produced it then and now must have existed from the creation of the world; and it is strange that it should not have been recorded in the annals of the New World before. The historian of the Jews makes mention of appearances which the men of those days considered as supernatural, such as armies fighting in the air, and pouring squadron upon squadron, until the heavens were one entire battle-field. These omens portended, as they thought, the destruction of the favoured city of the Most High. It is not surprising that before the progress of modern science such events should produce such impressions. It is the glory of the present age, that we have the opportunity of tracing many things to their causes, and at the same time reverence the Creator of them as much as those of former days.

A good story is told of the influence of the aurora borealis on the minds of some unacquainted with its natural causes in the early part of the last century, in our country. A marriage had been agreed upon between the son of a merchant and the daughter of a highly respectable landholder. The first day of the year was named as the happy one. The company, as it was usual in those days to invite all the connexions and relations, however remote, was very numerous,

and in great glee ; the sun set, and a most beautiful aurora borealis appeared ; the streams of fire were thrown nearly to the zenith ; all eyes were upon it, viewing the scene without fear, for they had heard that it passed away harmlessly when it appeared before. The good father of the young lady seemed distressed, and in the most solemn manner announced his determination to put off the wedding for that evening. This threw the whole company into consternation. The young couple looked disappointed, but said nothing, for that was a period of parental severity. At length, the clergyman arrived : he had been delayed by making some notes upon the phenomenon then before their eyes. The determination of the old gentleman was communicated to him privately, of which he seemed to take no notice, but went on explaining to all present as much as was then known by philosophers on the subject, and perhaps they knew about as much then as they now do. He expatiated upon the benevolence of the Deity, and suggested that this was probably one way which he had ordered to keep the atmosphere in the frozen regions in a proper state for respiration by the inhabitants, who were now without a cheering ray of the blessed sun ; that many months would pass away before the luminary would rise upon them ; and that the electricity agitated in this manner was as harmless as heat-lightning, and assisted the poor Laplanders and other nations to procure their food. He went on to illustrate his position by showing that the eclipses of the sun and moon, which were once supposed to portend disasters, were now used by the astronomer to measure time with accuracy, and to correct the

chronology of past ages ; and, in fine, to support the truths of the great volume of inspiration. The old man listened to all that was said with great attention, and at length came forward and avowed his conviction of his error, in viewing the northern lights as a manifestation of Divine displeasure. The marriage ceremony was performed, and all were happy. How much good a clergyman can do when he unites the wisdom of the serpent with the harmlessness of the dove.

CHAPTER XII.

Reflections on drawing near my Native Land—The Difficulties Women experience in gaining Information—The Value of Commerce—The Influence of Women—Love of the Ocean—Farewell to it—Sensations on arriving in the Harbour of New-York—Reaching Home—Public Attentions shown to my Husband and myself—Gratitude to Heaven for a safe Return.

I now felt that I was drawing near my native land, and began to question myself as to what purpose I had spent my time during this long and to me interesting voyage. Had I treasured up all the knowledge that I might have done? was a natural question. It is hard to satisfy one's self upon such an inquiry; but I had done something towards it. I was not prepared by education or habits to make the most of my situation, but still the consoling reflection arose that I had never distrusted Providence; had never repined; and, as far as I was able, cheered my husband in all his misfortunes—and they were not a few. I felt myself a much graver matron than when I embarked, and had more settled and, as I thought, more rational opinions for the government of life. I had suffered much, but enjoyed more; I had laid up a stock to reflect and reason upon during my future days; I had left my child, a short time to him, a long one indeed to me, but I thought I had learned enough to balance the pain of this absence in the attainment of that dis-

cretion which a mother should have in bringing up a child. It is by the kindness of Heaven that mothers do as well as they are found to do; for most of them in the early part of their days can have only the philosophy of the heart to direct them, not that of the head. My adventurous course was not a source of pride to me,—it was not for any specific purpose that I became a voyager, but simply to be a companion of my husband: my feelings or reasonings were uncontrolled, and the views I have taken of things, if not deep, are just as an unlearned mind would see them. Every thing was rare and strange to me, and necessarily excited my curiosity. If I had ever contemplated taking such a voyage, I think I should have been better prepared to bring home something more worthy of myself and my countrywomen; but as it is, they must take my intention for my deeds. The great difficulty we women feel in collecting information, is the want of order and classification of our thoughts; and we therefore labour much harder to arrive at true conclusions than those who have a regular pigeon-hole in which to place all sorts of information. Perhaps those who cabinet whatever they think worth preserving, do not enjoy them so much as we who think only of amusing ourselves, without enlightening others. I doubt whether a scientific observer would have had more thoughts than passed through my teeming brain; but he would have known how to arrange them, and have drawn conclusions tending to establish known truths, or elicit new ones; while whatever observations or conclusions I might make were liable to be dispersed for not knowing where to preserve them. The unstudied and unprac-

tised mind, however, observes many things that might escape the notice of the best educated.

Every vessel we met I amused myself with considering as a messenger to bring us some tidings from the friends we left at our departure ; but they often passed us at too great a distance to speak to them, and as it was a time of peace and the weather fair, we left each other with a pleasurable sensation, certain that each was well provided with necessaries for the remainder of the voyage. These sights thickened as we came nearer our own shores, and afforded new proofs that commercial enterprise was the characteristic of our countrymen.

On arriving so near the termination of my voyage, and taking a retrospective view of what had principally fixed my attention during its continuance, I felt my mind drawn to the contemplation of the regions we had visited in the Southern Pacific. I hope to live to see the islands in this ocean inhabited by my countrymen, under the protection of my country. There is no obstacle in the way of this. That the Kings of Portugal or Spain first erected their standard in those seas is nothing, or that the pope issued his bull in their favour is now nothing ; but that they who discover should possess, if they choose, is the common sense law of nations. Settlements might be made on some of the islands we have discovered, with every prospect of securing the commerce of those seas, or at least with sharing it with other nations. We have existed at all only about two centuries, and as an independent and free nation, acknowledged and received into the great family about half a century ; and yet we are considered the third commercial people on the

globe. We were prosperous as carriers of the commodities of other nations; and we shall be so in carrying our own. Agriculture and manufactures have increased with commerce and added to our independence, and will serve to support it if we do not have too much of what is termed the protecting system. Differences will arise in the minds of men how far each should be carried, and legislative power should assist either when it can be done without prejudice to the others; but it is certain that where all are active, and industrious, and intelligent, these things will be kept nearly right, although a few may complain on both sides. It is a subject of great consideration, and should engage the attention of every thinking being, and each should do a part to assist in the great work of building up a nation. We have now some copy of every great and excellent institution that time has produced, though many of them, as yet, are but outlines, and want filling up.

The first step to be taken in order that all the benefits may be derived from the islands of the Pacific which they are capable of affording, must be to spread the light of the gospel and civilization among them, which can only be done through the medium of missionaries. For this purpose I hope I shall not call in vain on my countrywomen, who have contributed so largely in supporting missionary establishments, and other works of charity, both at home and abroad; I implore them to continue their exertions, not only as matters of charity, but of knowledge also, and to assist all in their power to aid the great cause of true national glory. The rising generation are to be educated and directed, and the females of our country have much to do with this. That we possess the requi-

site capabilities, Hannah More, Miss Edgeworth, Mrs. Hemans,—and our own countrywomen, Mrs. Sigourney and Miss Sedgwick,—may be adduced; and in those branches of which mathematics is the basis, Mrs. Somerville has transcended all who have attempted to instruct youth in these matters before. A hundred others, on both sides of the water, may be brought forward to prove what women are doing in the great work of advancing the social and intellectual condition of mankind. This little enterprise of mine—little as it regards society—has taught me what my sex can do if called to act in the business of life.

I feel myself now wedded to the seas as much as the Chief of Venice was to the Adriatic. I love to contemplate its immensity, its sameness, its power as a medium of communication from one nation to another. The ocean has all the attributes of sublimity, immensity, and fearfulness; all the properties of usefulness; as affording food for man, and ten thousand pathways for the world. Description cannot reach all its characteristics: the poet who never surveyed the expanse of ocean, and saw only inland waters, has described it the best of all. Had he seen the Atlantic or the Pacific, in the bosom of their immensity, and felt a little more of that religion which declares that these oceans shall at the judgment give up their dead, he would have added to that description which has never been surpassed in force and beauty:

“ Roll on, thou deep and dark blue ocean, roll!
Ten thousand fleets sweep over thee in vain;
Man marks the earth with ruin—his control
Stops with the shore. Upon the watery plain

The wrecks are all thy deed, nor doth remain
 A shadow of man's ravage, save his own,
 When, for a moment, like a drop of rain,
 He sinks into thy depths with bubbling groan,
 Without a grave, unknelt, uncoffined, and unknown.

His steps are not upon thy paths ; thy fields
 Are not a spoil for him. Thou dost arise -
 And shake him from thee ; the vile strength he wields
 For earth's destruction, thou dost all despise,
 Spurning him from thy bosom to the skies,
 And send'st him, shivering in thy playful spray,
 And howling to his gods, where haply lies
 His petty hope in some near port or bay,
 And dashest him to earth again. There let him lay.

The armaments which thunder-strike the walls
 Of rock-built cities, bidding nations quake
 And monarchs tremble in their capitals—
 The oak leviathans, whose huge ribs make
 Their clay creator the vain title take
 Of lord of thee, and arbiter of war :
 These are thy toys, and as the snowy flake
 They melt into thy yest of waves, which mar
 Alike the Armada's pride, or spoils of Trafalgar !

Thy shores are empires, changed in all, save thee,
 Assyria, Greece, Rome, Carthage, what are they ?
 Thy waters wasted them while they were free,
 And many a tyrant since ; their shores obey
 The stranger, slave or savage ; their decay
 Has dried up realms of deserts : not so thou ;
 Unchangeable save to thy wild waves' play,
 Time writes no wrinkle on thine azure brow ;
 Such as creation's dawn beheld, thou rollest now.

Thou glorious mirror, where the Almighty's form
 Glasses itself in tempests ; in all time,
 Calm or convulsed, in breeze, or gale, or storm,
 Icing the pole, or in the torrid clime
 Dark heaving ; boundless, endless, and sublime ;
 The image of eternity ; the throne
 Of the Invisible ; even from out thy slime
 The monsters of the deep are made ; each zone
 Obeys thee ; thou goest forth, dread, fathomless, alone !
 And I have loved thee, ocean !"

On the 26th day of August we discovered land : it was my own, my native land, and we were making fair progress towards it, but my impatience was such that I could have scolded the Antarctic for being so sluggish, notwithstanding I had, during the whole voyage, loved her as a dear little boat that had carried me safely ; and this affection increased as the time passed on. As we approached the harbour of New-York, I could not forbear comparing it with others I had seen. What city in the world is so advantageously placed ? Surrounded by rivers, and washed by the sea, its water privileges are everywhere. Europe, nor Asia, nor Africa, nor South America has any thing to compare with it. Its deep waters and its crowded mart of merchandise are unequalled in this country ; and when we add to this, the connexion of the great inland seas of the north, it has no rival anywhere. In less than fifty years its population has increased more than tenfold : in 1783 it contained 20,000 inhabitants ; it now numbers more than 200,000. Its wealth has increased with its population, and all seemed so busy and happy. A forest of masts appeared on either side of the city, closer together than the cedars of Lebanon in their native soil. The time is fast coming, thought I, when this great city will be ten times greater than it now is, and rival all of ancient or modern times. And this is indeed my home ! —my native land.

On the 27th of August I came on shore. As I left the little bark, I could not help exclaiming, Have I been almost two years in that schooner ! I had, and was as safe in her, I believe, as I should have been in a seventy-four, if not altogether so comfortable at all times. I now stepped upon the

soil of my native city; its spires, its steamboats, its bustle, all delighted me, for it was New-York as I had left it; changed only by increase, and that not so much as to give it in any way a strange look. In a few moments I embraced my child—my mother—my sisters—and some of my friends—and was greeted as one indeed from a far distant country. But on looking around, I saw the emblems of bereavement; my mother was again a widow—her husband, my worthy step-father, had died of a consumption during my absence. He was truly a good man; he had been to me as an own father, he was kind to my mother, and kind to her offspring, which she had brought at her marriage. A dear aunt, too, had in my absence paid the debt of nature. I mingled my tears with those of my surviving relatives, at our loss; but who can expect to find home as it was left, after so long an absence? My mother and my child were alive and well; and I thanked kind Heaven for what had been preserved, while I sincerely mourned the departed. New cares were soon allotted me, for in nine days after my return I was the happy mother of another son, a fine child in form and strength. His mother's Journal may, in some future day, be read by him, and he may be stimulated to put some of my plans in a train of experiment: but all is in the hands of Heaven—the will of the Lord be done.

The public soon caught some fragments of our adventures, and the seaman LEONARD SHAW published his account of the massacre at the newly discovered islands; our story was in every print, and the sympathies of the public were expressed in warm congratulations. Business soon took my husband to the south, and wishing me to accompany him I did so, and was received with kindness

and attention wherever we made any stop. So many questions were put to me, that I soon after determined to give my narrative to the public. I feel grateful to my countrymen and women for the courtesies I have received from them, but more so to that Being who, in his infinite mercy, has protected me in every peril, and brought me again to my native land, to praise him, and to enjoy all the blessings that land affords. I can sing aloud, with all my soul, this hymn of praise to him who controls the winds and seas :—

“ Though they through foreign lands should roam,
 And breathe the tainted air,
 In burning climates, far from home,
 Yet thou, their God, art there.

Thy goodness sweetens every soil,
 Makes every country please :
 Thou on the snowy hills dost smile,
 And smooth'st the rugged seas !

When waves on waves, to heaven upreared,
 Defied the pilot's art ;
 When terror in each face appeared,
 And sorrow in each heart ;

To thee I raised my humble prayer,
 To snatch me from the grave !
 I found thine ear not slow to hear,
 Nor short thine arm to save !

Thou gavest the word—the winds did cease,
 The storm obeyed thy will ;
 The raging sea was hushed in peace,
 And every wave was still !

For this, my life, in every state,
 A life of praise shall be ;
 And death, when death shall be my fate,
 Shall join my soul to thee !”

VALUABLE WORKS

PUBLISHED BY

J. & J. HARPER, 82 CLIFF-ST.,

NEW-YORK,

And for Sale by the principal Booksellers in the United States.

HISTORY OF THE JEWS. By the Rev. H. H. MILMAN. In 3 vols. 18mo. Illustrated with original Maps and Woodcuts.

"The narrative of the various and highly interesting events in that period flows on in a chaste style; and a thorough knowledge of his subject is evident in every page. The work is spirited, well arranged, and full of information, and of a wise and well-cultivated spirit."—*Athenæum*.

"Professor H. H. Milman is one of the most chaste and classical writers of the age. The History of the Jews embraced in the volumes before us, has already passed through three editions in England, and is highly and justly commended by many of the most respectable periodicals."—*N. Y. Journal of Commerce*.

"It is written in a very interesting manner—in a more philosophical spirit, and with more depth of reflection, than is generally found in histories of this nature. It is not wanting in historical condensation, and the colouring of the style is lively and picturesque."—*N. Y. Evening Post*

LIFE OF NAPOLEON BONAPARTE.

By J. G. LOCKHART, Esq. With copperplate Engravings. In 2 vols. 18mo.

"We anticipate a prodigious circulation for this attractive work. It is drawn up with consummate ability. Indeed, we have seldom perused a work more uniformly interesting in its details."—*Sun*.

"It is, unquestionably, in a brief and tangible form, the most popular History of Napoleon that has been yet produced."—*Atlas*.

"This is a much better book than any other in English on the same subject."—*Athenæum*.

LIFE OF NELSON. By ROBT. SOUTHEY, Esq. With a Portrait. 18mo.

"This is the best work that ever came from the pen of the laureate, and it is an excellent specimen of biography."—*New-Eng. Palladium*.

"The merits of this work are so well known that it is altogether unnecessary to recommend it to our readers."—*N. Y. Evening Post*.

"Southey's fine and popular biography of Nelson was very much wanted, and is now to be had very cheap, in a very neat and convenient form."—*N. Y. Commercial Advertiser*.

LIFE OF ALEXANDER THE GREAT.

By Rev. J. WILLIAMS. With a Map. 18mo.

The style is good, and the narrative well conducted. A modern history of this famous warrior cannot fail to be interesting."—*N. Y. Daily Advertiser*.

"The work is instructing, and inherits a greater share of interest from the fact, that the history of this *ancient Napoleon* is disintegrated from the mass of general history, and presented by itself. The style is lucid and well studied."—*N. Y. Journal of Commerce*.

"It is ably and eloquently written."—*B. Journal*.

NATURAL HISTORY OF INSECTS.

Illustrated by numerous Engravings. 18mo.

"Of all studies, perhaps, there is none more captivating than that of animated nature. . . . The present volume is peculiarly useful and agreeable."—*N. Y. Mirror*.

"The subject is full of interest and satisfaction, and is adapted to all classes of readers."—*Albany Evening Journal*

"The information is minute, well arranged, and clearly imparted, and cannot but recommend the work to general perusal in families."—*N. Y. Standard*.

"It seems to us that it will prove at once agreeable and instructive to persons of all classes, and occupy an appropriate place in the Family Library."—*N. Y. Daily Advertiser*.

LIFE OF LORD BYRON. By JOHN GALT,

Esq. 18mo.

"This volume has great merit, and is a valuable acquisition to literature."—*N. Y. Spectator*.

"The sprightly pen of the author has communicated uncommon interest to this work, and he appears to have done perfect justice to its inspired subject."—*Albany Daily Advertiser*.

"Mr. Galt is one of the most fascinating writers of the age."—*Journal of Commerce*.

LIFE OF MOHAMMED, Founder of the

Religion of Islam and of the Empire of the Saracens.

By the Rev. GEORGE BUSH, M.A. With a plate. 18mo.

"It seems to us to be a good narrative of the life of the great Arabian impostor, written in a fine style. . . . We are not aware that any other work of the same size contains the same quantity of information relative to the matters treated of, in as agreeable a form."—*Com. Advertiser*.

"Mr. Bush is a scholar of extensive acquirements, and well fitted for the task which he has undertaken in this volume."—*N. Y. Observer*.

"In the collection of materials, the author appears to have neglected no source from which valuable aid was to be expected."—*Philadelphia Daily Chronicle*.

"The history of the eminent impostor cannot but be a work of interest to every enlightened mind."—*Penn. Inquirer*.

DEMONOLOGY AND WITCHCRAFT.

By WALTER SCOTT, Bart. With a Plate. 18mo.

"The work is curious, interesting, and instructive."—*Inquirer*"This volume is most interesting, and will be read with great pleasure by almost every class of readers."—*U. S. Gazette*."It would be difficult to select a more interesting subject for the pen of a man of genius than that of popular superstitions. To say that Scott has made more of it than any other man could have done, is only to add another tribute to his acknowledged pre-eminence."—*Boston Statesman*."The subject is most alluring, and the manner in which it is handled is magical."—*Athenæum*.**HISTORY OF THE BIBLE.** By Rev. G.

R. GLEIG. With a Map. In 2 vols. 18mo.

"The style of it is surpassed by no work with which we are acquainted. Historical and biographical facts are well stated; the prominent difficulties that present themselves to the mind of an intelligent or skeptical reader of the Bible are boldly exhibited and ably explained; the most plausible objections advanced by modern infidels are answered in a very philosophical, learned, and conclusive manner. The author has embodied in it a vast deal of learning and research; has discovered superior ingenuity and force of intellect, and furnished, withal, a specimen of fine writing, which must secure a most favourable reception, as well among persons of taste as those who are fond of Biblical studies."—*Albany Telegraph and Register*.

POLAR SEAS AND REGIONS. By Pro-

fessors LESLIE and JAMESON, and HUGH MURRAY, Esq. With Maps and Engravings. 18mo.

"A work from such hands on such a subject cannot fail to be both interesting and valuable."—*N. Y. Evening Post*."The three eminent men who have produced this compilation have rendered a great service to the cause of philosophy and knowledge."—*N. Y. Commercial Advertiser*."The writers are gentlemen of first-rate standing in the scientific world, and the subject is one to which every curious mind is attached by a sort of involuntary impulse."—*N. Y. Journal of Commerce*.**LIFE AND TIMES OF GEORGE IV.**

With Anecdotes of Distinguished Persons. By the Rev GEORGE CROLY. With a Portrait. 18mo.

"Mr. Croly has acquitted himself very handsomely. His subject is one of much interest, and he has treated it with unusual impartiality. The author's style is chaste, classical, and beautiful, and it may be taken as a model of fine writing. It is worthy of his genius and his education."—*Mercantile Advertiser*.

"Mr. Croly is not merely a fine writer, but a very powerful one. His outline is as bold and broad as his colours are glowing. He writes like a man well acquainted with his subject."—*Eclectic Review*.

DISCOVERY AND ADVENTURE IN AFRICA. By PROFESSOR JAMESON, JAMES WILSON, Esq., and HUGH MURRAY, Esq. With a Map and Engravings. 18mo.

"The names of the distinguished individuals by whom the volume has been prepared, offer a sufficient pledge for the faithful and accomplished execution of the work: and the field of their labours is one of almost unrivalled attraction for whatever is new, strange, or mysterious in historical narrative, or bold and perilous in adventurous exploit."—*The Atlas*.

"This work we believe will be interesting to every class of readers, especially to the philanthropist and Christian."—*N. Y. Evangelist*.

LIVES OF EMINENT PAINTERS AND SCULPTORS. By ALLAN CUNNINGHAM, Esq. With Portraits. In 3 vols. 18mo.

"We advise all those of our readers who have any respect for our recommendation, to read these three volumes from beginning to end; and are confident of the thanks of such as shall be induced by our advice to procure for themselves so great an enjoyment."—*N. Y. Mirror*.

"This is one of the best written and most instructive books of the series to which it belongs."—*N. Y. American*.

"The whole narrative is of a lively and alluring kind, flowing in its language, and enriched with ceaseless anecdote."—*N. Y. Atlas*.

HISTORY OF CHIVALRY AND THE CRUSADES. By G. P. R. JAMES, Esq. With an Engraving. 18mo.

"The present volume may safely be pronounced an ornament to the literature of the day, and Mr. James be esteemed a writer of great clearness and strength."—*N. Y. Standard*.

"The author of this work has done the public a service, which we think will be duly appreciated."—*Christian Herald*.

"Mr. James is well known as an agreeable writer; and the subjects of this volume are such as can scarcely fail to prove both amusing and interesting."—*N. Y. Daily Advertiser*.

LIFE OF MARY QUEEN OF SCOTS
By H. G. BELL, Esq. With a Portrait. In 2 vols. 18mo.

"It is decidedly the most interesting account we have ever seen of that lovely and unfortunate being. We have always felt that Mary was innocent of the great crimes charged against her by her furious and deadly enemies; but our understanding was never before convinced. It was with a feeling of eager joy, that we, for the first time in our lives, admitted the full conviction of her innocence. The book is written with much candour."—*Massachusetts Journal*.

"The reader will be pleased to learn that the life of Mary has been written anew, by one who appears, both in temper and talent, extremely well qualified for the task."—*N. Y. Atlas*.

ANCIENT AND MODERN EGYPT. By the Rev. M. RUSSELL, LL.D. With a Map and Engravings. 18mo.

"All that is known of Egypt is condensed into this history; and the readers of it will find themselves well repaid for their labour and money."—*New-Haven Advertiser*.

"The information respecting the present state of this interesting country will be found peculiarly valuable."—*New-York Mirror*.

"The work is written in a very happy style, and presents a mass of knowledge of the most useful and instructive character, collected together by great industry and research."—*Baltimore Republican*.

HISTORY OF POLAND, from the earliest Period to the present Time. By JAMES FLETCHER, Esq. With a Portrait of Kosciusko. 18mo.

"This work recommends itself to public notice by its clear, concise, and impartial history of a country and a people for whom the feelings of every lover of freedom are deeply interested."—*N. Y. Atlas*.

"Of the writer's fairness and research we have a very good opinion; and his book is just the thing that is wanted at the present moment."—*N. Y. American*.

"No work has for a long period been published here so deserving of praise and so replete with interest."—*American Traveller*.

FESTIVALS, GAMES, AND AMUSEMENTS, Ancient and Modern. By HORATIO SMITH, Esq. With Additions. By SAMUEL WOODWORTH, Esq., of New-York. With Engravings. 18mo.

"The book contains a mine of information on the subjects embraced in its title, and should be placed in every family."—*N. Y. Standard*.

"We can commend the book as both attractive and useful."—*N. Y. American*.

"The book is highly amusing and interesting, as well as instructive."—*Pennsylvania Inquirer*.

"The present work is characterized by great research and learning employed in illustrating a subject of much general interest."—*Baltimore Republican*.

LIFE OF SIR ISAAC NEWTON. By DAVID BREWSTER, LL.D. F.R.S. With a Portrait and Woodcuts. 18mo.

"The present publication cannot fail to prove acceptable and useful."—*N. Y. Standard*.

"The biography of the greatest astronomer that ever lived cannot be fraught with else than interest."—*N. Y. Mercantile Advertiser*.

"This is the most complete and authentic biography of this illustrious man that has yet appeared."—*N. Y. Evening Journal*.

"An excellent biography, beautifully written, and comprising a large amount of useful information."—*New-Haven Chronicle*.

PALESTINE, OR THE HOLY LAND.

From the earliest Period to the present Time. By the Rev. MICHAEL RUSSELL, LL.D. With a Map and nine Engravings. 18mo.

"An interesting book."—*New-Haven Advertiser*.

"The whole work is imbued with a sacred engrossing interest."—*Connecticut Mirror*.

"It is written in a very popular and attractive style."—*N. Y. Evening Journal*.

"The whole volume will amply repay perusal."—*N. Y. American*.

"This work is the most desirable record of Palestine we have ever seen."—*American Traveller*.

MEMOIRS OF THE EMPRESS JOSEPHINE. By JOHN S. MEMES, LL.D. With Portraits.

"The language of the author is beautiful, and his powers of description exceedingly fine."—*N. Y. Evening Journal*.

"A very entertaining book."—*N. Y. Commercial Advertiser*.

"This is the first complete biography which has ever appeared of that much admired woman."—*N. Y. Constellation*.

"This work will be found to possess a beauty of language, a fascination of style, and a depth of interest which few works of this kind can claim."—*Boston Traveller*.

THE COURT AND CAMP OF BONAPARTE. With a Portrait of Talleyrand.

"This work is highly interesting."—*N. S. Gazette*.

"The volume will be read with interest and instruction."—*Conn. Mirror*.

"The sketches are entertaining and well written, and constitute a valuable compend for reference on all the more important subjects connected with the career of this extraordinary dynasty."—*Washington (D. C.) Globe*.

LIVES AND VOYAGES OF DRAKE, CAVENDISH, AND DAMPIER; including an introductory View of the earlier Discoveries in the South Sea, and the History of the Buccaneers. With Portraits.

"This is certainly one of the most interesting compilations which the press has sent forth for some years."—*N. Y. Evening Journal*.

"While in the present work the young will find delight, the aged and mature will discover matter of deep interest and useful reflection."—*Baltimore Minerva*.

"These volumes will beget a love for appropriate and useful reading, and cannot but be widely beneficial to individuals and communities."—*Connecticut Mirror*.

DESCRIPTION OF PITCAIRN'S ISLAND AND ITS INHABITANTS. With an authentic Ac- count of the Mutiny of the Ship *Bounty*, and of the sub- sequent Fortunes of the Mutineers. With Engravings.

"The reader may here find in faithful history events of thrilling inter-
est in the varied fortunes of seamen."—*Southern Religious Telegraph*.

"There is hardly any reading more interesting than voyages, and the
accounts in this book are among the most interesting we have ever
perused."—*Boston Statesman*.

"A subject having more points of interest can scarcely be imagined,
and the abilities and opportunities of the author give an assurance that
they have not been overlooked."—*Atlas*.

"The story is exceedingly well told—it is true—and is embellished
with particulars of which the public have not before been put in posses-
sion."—*Connecticut Mirror*.

SACRED HISTORY OF THE WORLD, as displayed in the Creation and subsequent events to the Deluge. By SHARON TURNER.

"The volume contains a vast mass of interesting facts to illustrate the
different departments of the natural world. It bears marks of great re-
search, and is worthy of a careful perusal."—*Connecticut Observer*.

"We can most heartily recommend this work as eminently worthy of
a place in every library."—*Churchman*.

"It is a book calculated to be of great general utility; and will be
found particularly convenient for bible-classes, who are studying the
Mosaic History of the Creation."—*Commercial Advertiser*.

MEMOIRS OF CELEBRATED FEMALE SOVEREIGNS. By MRS. JAMESON. In 2 vols.

"A readable book, in which good use is made of a subject not the most
promising. . . . The authoress tells a plain story with facility, and makes
neat and appropriate comments with a happy freedom."—*Churchman*.

"Many a more ambitious history has been executed with less talent
and happy candour than these moral and picturesque sketches."—*Boston
Daily Advocate*.

AN EXPEDITION TO EXPLORE THE COURSE AND TERMINATION OF THE NIGER. By RICHARD and JOHN LANDER. In 2 vols. Maps, &c.

"They (the Landers) tell a story of no small interest, and no few vicis-
situdes, with manly honesty and simplicity, and considerable life and
vigour. In description of local scenery they are often eminently happy;
in narrative never tiresome: in sketches of character and manners, inter-
esting and successful, because artless and faithful."—*Churchman*.

"The incidents were many and interesting; while their discoveries
have brought to our knowledge scores of savage tribes and nations. We
know of few works of this description which have added as much to our
geographical knowledge, or depicted in such painfully interesting colours
the ignorance and wild barbarism of unchristianized Africa."—*N. Y. Observer*

INQUIRIES CONCERNING THE INTELLECTUAL POWERS AND THE INVESTIGATION OF TRUTH. By JOHN ABERCROMBIE, M.D.

"It will not only feed, but form the public intellect. It cannot be disseminated too widely in a nation eager for knowledge, keen in inquiry to a proverb, and accustomed to think no matters too high for scrutiny, no authority too venerable for question."—*Churchman*.

"It will be read, or rather *studied* with delight and profit by those who wish to cultivate an acquaintance with the phenomena of the intellectual world. The author's illustrations are clear, and his reasoning sound."—*Southern Religious Telegraph*.

THE LIVES OF CELEBRATED TRAVELLERS. By JAMES A. ST. JOHN. In 3 vols.

"The work is well edited, and will unquestionably be perused with satisfaction and profit, especially by the younger class of the community."—*Baptist Repository*.

"But few works have ever been published which comprise more general information in a brief form. . . . It is a publication which will commend itself to all."—*Albany Daily Advertiser*.

"The whole is an interesting publication, and may be properly consulted both by the adult and youthful student."—*Albion*.

LIFE OF FREDERICK THE SECOND, KING OF PRUSSIA. By LORD DOVER. In 2 vols. With a Portrait.

"Lord Dover has in these volumes, by rejecting all that is exceptionable or of slight interest, while he retained every thing essential, made up a comprehensive and very attractive book."—*N. Y. American*.

"An agreeably written and highly interesting piece of biography. . . . The biographer's own morality is of the soundest kind; and his reflections, in handling the infidel principles and correspondence of the royal skeptic, are such as they should be. The poison is not allowed to work by being passed over without comment."—*N. Y. Commercial Advertiser*.

SKETCHES FROM VENETIAN HISTORY. In 2 vols. With Maps and Engravings on Steel and Wood.

"A history of the Venetian republic, accessible to all classes and ages, prepared for popular use, has been much wanted for a long time, and this production is admirably calculated to supply it."—*Baltimore American*.

"The work is written in a style of brilliant narrative from authentic materials, and deserves a place in every library."—*Mobile Gazette*.

"The able manner in which the author has accomplished his task is above all praise."—*Boston Statesman*.

"These 'Sketches' are gleaned from several very rare works, and brought within the reach of every person who is desirous of acquainting himself with the history of this ancient people; and no one, after reading these little volumes, will regret his expenditure of time and money."—*N. E. Review*.

INDIAN LIVES; or, an Historical Account
of those Individuals who have been distinguished among
the North American Natives as Orators, Warriors, States-
men, &c. By B. B. THATCHER, Esq. In 2 vols.

"The author has spared no pains in making himself acquainted with the proper materials for a work of this character; and their arrangement reflects much credit on him."—*N. E. Christian Herald*.

"We like these volumes well. They are written with a perspicuity and liveliness that recommend them to all. Mr. Thatcher has ably filled up a chasm in American literature. These two volumes blend the authenticity of history with the thrilling excitements of forest narratives, descriptive of the native energy and grandeur of the old free kings, who ruled the new-found America."—*Badger's Weekly Messenger*.

**HISTORICAL AND DESCRIPTIVE AC-
COUNT OF BRITISH INDIA.** From the most remote
period to the present time. By several popular Authors.
In 3 vols. With a Map, and many Engravings on Wood.

"The history of British India is uncommonly interesting....The whole work bears the impress of impartiality, fidelity, research, and accuracy."—*Baptist Repository*.

"Such authentic and extensive information relating to this interesting portion of the globe has never before been so happily imbodyed."—*N. Y. Traveller*.

LETTERS ON NATURAL MAGIC. Ad-
dressed to Sir Walter Scott, Bart. By SIR DAVID
BREWSTER, K.H. LL.D.

"The present work may be regarded as one of those results of modern research and study, by which society at large will be benefited; and the perusal of it would very profitably and pleasantly employ the hours now wasted upon books which leave not a single salutary impression upon the mind."—*Presbyterian*.

"We know of no other work or treatise which has compressed, within the same compass, so much useful and various matter upon the many subjects falling within the range of the investigation."—*Com. Advertiser*.

THE HISTORY OF IRELAND. By W. C.
TAYLOR, Esq. With Additions, by WILLIAM SAMPSON,
Esq. In 2 vols. Plates.

"This is a calm, clear, and a candid book.... A sober and dispassionate book on this tender subject was much wanted.... Mr. Taylor has performed his melancholy task with no ungentle spirit, and written the most consistent narrative of those events that we have yet seen.... The work abounds with pictures of war and desolation—of happiness and prosperity—of sudden elevations and sad overthrows; if there is much violence and wrong, there is also much nobleness of mind, generosity of nature, and gentleness of heart."—*The Athenaeum*.
